Sat. April 25 - 1908

I left New York at 8:58 A.M. on the N. Y. Central R.R. from the Harlem Station.

A slight rain was falling which continued intermittently until a short time after noon - by 4:30 P.M. the sun had broken thru the clouds and the beautiful sunset gave promise of a perfect day on the marshes.

The first part of my trip, from New York to Albany, was along the shores of the Hudson River, which is always beautiful but today particularly so. A heavy blanket of grey fog lay over the water; this gradually rose till it hung just at the tops of the catfolds. The bases of the mountains, veiled in soft shades of brown and purple, were reflected in the water as in a mirror. The forest trees have only just begun to bud, but the "pussy-wills" are out and the grass is everywhere of the most intense green.

I saw a few ducks in a marsh on the east side of the tracks and one on the Hudson; Cormorants were plentiful along the river, and flocks of what I took to be Quicksilver gulls were also seen. A hawk,

probably Circus hudsonius, alighted
in a field near the tracks.

From Albany the country was
mostly rolling, with many moraine
hills, and frequent swamps in the
lowlands. The banks & edges of
the swamps, studded here & there
with green bushes made a beautiful
picture in the sunshine of the
late afternoon.

Sun. Apr 26

I was surprised on waking this
morning to find how ^{much} further
vegetation had progressed in
Michigan & Wisconsin than in
the East. The fruit trees were bud-
ding & the apple &berry trees in
full bloom. Last year when I
left New York I found the foliage
condition existing, for the spring
was decidedly more advanced along
the sea coast. In a pond, a few
miles below Crystal Lake, O. H. I
saw from the bank one Olyssenus sp.
& two or three other mosses in the
water which I take to be all of the
same genus. However the water was
too short for positive identification.

Apr 30/18

I left Beloit Wisconsin at 8.10 P.M.; going to Janesville where I caught the 9.15 P.M. train for St. Paul. On Beloit & especially many spring birds were to be seen. The first thing I heard upon awakening Monday morning was the familiar call of the Flicker (*Colaptes*)

I saw many chimney swifts (*Chætura pelasgia*) a few Red headed woodpeckers Kingbirds (*Tyrannus tyrannus*), *Melospiza fasciata* bluebirds Robins Redwings, house wrens and one or two Anas sp.

May 1st of I left Minneapolis last night at 10.45 on the Northern Pacific. It was rather cold all day yesterday with a little rain, some sunshine & occasional flurries of snow. In the A.M. I met one of my college friends and we went out to Minne-ha-ha Falls, & from there to Fort Snelling. I was particularly interested in the latter place as we have ^{at the museum} considerable zoological material from there collected by Dr. E. A. Mearns when he was stationed at the fort. This morning when I awoke, I found we had passed through the state of Minn.

and were well into North Dakota
 Mile after mile of wheat land could be
 seen from the train whose numerous
 ploughs were at work cultivating. I
 have as yet seen only one of the steam
 ploughs, for most of them were drawn
 by five, six or seven horses.

Now, at 10 o'clock, we are passing
 through rolling prairies, stretching
 as far as the eye can reach in
 every direction. Here & there a farm
 house may be seen, out on the
 bare prairie, or perhaps nestled
 into the side of a little hill or gully.
 Occasionally, a little town, consisting
 of a saloon, a general store & a few
 houses, will come in view. These
~~little~~ towns seem to have no par-
 ticular reason for their existence at
 that spot, but like "Topsy" to have
 just "grown" - In some ^{places} spots the
 in this section of N. Dakota (the south
 central part) very little of the land
 seems to be under cultivation, it
 being mostly used for pasture.
 At several places near the track I
 have seen shadowy ponds in
 which were flocks of ducks and
 on the margins a few yellow legs

or sandpipers. At times also, a large hawk will come into view circling up & up until it becomes a mere speck in the intense blue of the sky above. It is a beautiful sight to see the prairies, rich in changing tones of brown & green stretching away ~~far~~ ^{either} side of the train, as dotted here & there by herds of cattle, or perhaps a flock a sheep. It takes but a slight ~~amount~~ amount of imagination to believe that they are the last remains of the great herds of buffalos which once roamed these very plains. In most places not a tree is in sight, the long reaches of prairie being broken only by a fence for a settler's cabin.

I just saw two Bitterns; probably Batarus leptiguinus fly up from a little marsh, & a great flock of dark birds which seemed to be Corobirds.

4 P.M. Since about two o'clock this afternoon we have been passing thru the bad-lands of N. Dakota & Montana. The scenery of course changed radically as soon as we struck this section of the country. At first only single conical "buttes" would rise from

out of the plains but gradually they became larger and more frequent. There when we were in the bad-lands themselves the buttes were joined in great chains like miniature mountains. The gullies between these butte-chains, as well as in the gulches of all shapes & sizes making a net-work of hills & valleys.

The sides of the buttes ~~are~~ bear little vegetation other than brown bunch grass and sage brush, and the tops are usually completely裸露.

Here & there outcrops of stratified red sand stone appear, giving beautifful reds & purples, while contrasted with the olive green of the sage brush, put a dash of rich color into the somber shades of the landscape.

At one place almost on the border between Dakota & Montana, I noticed a typical little cowboy town backed up against a high chain of buttes with a narrow stream of brown water in front. I had just remarked what a typical place it was when a sign came into view bearing these words

The Little Missouri River
at one time
Theodore Roosevelt
ranched in this valley.

As I looked at the ~~river~~ & rugged surroundings, ~~they~~ they seemed to me exemplary in a way, of the undauntable courage, & healthy, hardy spirit which lives in the President of Our Country. The ground in the valley was completely intersected with the burrows of a great colony of Prairie Dogs (Cynomys) & it was very interesting to watch the little fellows sitting at the edges of their holes, their hands crossed over their yellow breasts watching the train as it passed with their shiny black eyes. Sometimes one would become frightened, & disappear instantly looking as though he had fallen over backward into his hole. As we left Dakota behind us & got further into Montana the buttes became larger, & of greater extent, and the gullies between them deeper. And these are the bad lands of the West.

May 3d '08

Since early morning the train has been working its way slowly up into the mountains of western Montana. At first we were among the foothills, but now at 2.30 P.M. we are well into the mountains themselves, being about five thousand feet above sea level. In the distance peak after peak may be seen, their snow covered caps lost in the heavy rain clouds which cover the sky. The nearer hills are ^{mostly} covered and ~~mostly~~ with scrubby pine trees, which become shorter & thicker in distribution as the summits are approached.

Tall slender spruces just feathering with their yellow buds, are thickly mixed with the pines at the bases of the foot hills giving a touch of color to the masses of dark green.

Birds seem fairly plentiful, especially Falco sparverius. I have seen a number of these hawks, singly or in pairs, and some have come so close to the train as to make identification positive. While passing a rather narrow stream I observed five or six Ardea herodias at different times, and a few ducks.

Ceryle olivacea, Corvus americanus

Circus hudsonius, Strewnella magna
neglecta and Pipilo are also
plentiful.

May 6th After a most delightful and wonderful ride through the mountains of Washington, I reached Seattle Monday P.M. at 2.30 I looked up Capt. David Jarvis, to whom I had a letter from Mr. Frank Wood, and found Capt. Jarvis a very pleasant man. He gave me a letter to a friend of his in Victoria, and the next day (Tuesday) at 8.30 a.m. I left on the boat "Chippewa" for Vancouver Island. The ride up the sound, and down the beautiful straits of Juan de Fuca is a moving picture of sparkling water and hills of emerald green, with the snow covered peaks of the Olympics for a background.

I registered at the "Empress" hotel upon my arrival at Victoria, which is one of the finest building of its kind, out of New York City and at once went to the American Consulate, I found the Hon. A. E.

Smith, to be a pleasant elderly gentleman, who was pleased to assist me in any way. Through his influence I was able to have my trunks passed by the Postmaster officially free of duty, thereby saving considerable expense. Capt. Balcolm, of the Pacific Whaling Co. to whom I had letters, was not at his office, and consequently I had to wait until today before seeing him.

May 16-08

Dr. Bismüller, Pres. of the Pacific Whaling Co., was at the station with a friend, and consequently there was no noon for work. He was expected to come in on the 13th & telegraphed for me to await his return in Victoria. Not wishing to remain idle, I packed up a few collecting instruments and took the train for Shannigan Lake. This is a beautiful body of water on the Esquimalt & Nanaimo Railway, some twenty-six miles from Victoria. The country surrounding the lake is mountainous, the hills reaching a height of 1000 feet, and ^{are} covered with coniferous forest. There are very few deciduous trees, the forest being mostly composed of pines, firs & hemlock. Deer are plentiful, bear are some-

traps taken, and occasionally a panther is killed - a short time before my arrival a large panther had been poisoned near the lake. Otters were once frequently trapped & many marten are still taken - also mink. No muskrats or rabbits are found on the island.

I spent four days collecting at Shawinigan Lake and secured a number of birds, besides a few white-footed mice, two rats and one shrew. These were all caught ~~about~~ ^{near} old stumps & logs near the lake shore, as were the rats & shrew. I found a number of mice in the traps partly eaten, usually with the head & eyes completely gone. I believe it was the work of shrews but altho' I baited several traps with meat & mice, I was unable to get any specimens in that particular place. The woods were full of ~~the~~ Sooty Grouse (*Dendragapus obscurus fuliginosus*) but the male birds were exceedingly hard to find.

In the morning & evening the oo-oo-oo-oo of the codgers could be heard from every direction, but when ever when one had located the tree

in which a bird was "booting" it was next to impossible to discover the author of the sound. The grouse ~~were~~ always chose the tallest trees in which to perch while calling, and when hiding close to the trunk in the topmost branches of a fir 250 or 300 feet high were effectually protected from enemies on the ground. The female kits on the contrary were always to be found upon the ground and would flushed from almost under one's feet. I found one nest of this grouse containing four eggs well along in incubation and knew of two or three others nests in neighboring localities.

I shot one ~~Cape~~ Parus (Parus halaticatus carolinensis) and found the nest which was built on the top of a old stump at some forty feet high. The male bird was very wild and I was unable to get near enough for a shot, altho' he flew above my head constantly. I did not climb up to the nest as it would have been practically impossible, but since I found several eggs in the vicinity of the bird's shot, I judge the nest had only been built a short time.

I collected a few Song Sparrows (*melospiza cinerea morphna*) which were everywhere abundant. These birds were continually being caught in the traps, which I had set along old stumps for mice, and it was rare if I did not find two or three every morning with their skulls crushed by the trap spring - usually birds so caught would be found with their eyes still out.

I shot one Red Squirrel (*S. h. vancouverensis*) + saw only two others - a rather remarkable occurrence as they are reported as very common, while lying in wait for deer one evening near a small meadow, a red squirrel came down on a log close to me + regarded me curiously with his round black eyes, but when I raised my hand, he dashed off into the woods as if he had forgotten an important engagement.

May 15-08 Upon receiving a telephone message from Capt. Baldwin, I left Shawnee Lake Wed. A.M. at 11 o'clock. On the train I met Dr. Kissmiller who was returning from the whaling station and came on to Victoria with him.

I completed arrangements with him for my trip to the station and will leave tomorrow night, May 16, on the ship "Teek" for Sachart, Barclay Sound where the whaling station is located. Today after arranging for the shipment of two barrels of plaster, gasoline, alcohol, etc I took a short walk thru Victoria Park (ac Beacon Hill Park) to collect ants for Dr. Wheeler. The Park is one of the most beautiful places in which I have ever been! A small artificial lake, crossed by an arched stone bridge occupies one end, and this is surrounded by trees of all sorts + flowering shrubs in profusion. Taking one of its many paths I followed toward Beacon Hill, and suddenly came out upon a sort of head covered with a mass of bushes in full bloom. These were the English Broom & most beautiful plants they are! The flowers look something like large sweet peas, and if any of the most intense yellow. From the top of Beacon Hill, looking out over the straits of Juan de Fuca toward the blue mountains of the Olympics, their snow covered caps glistening in the moon.

ing scene, a more beautiful picture could hardly be imagined. The gentle slope of the hill to the water's edge is ~~a field~~ a mass of yellow bloom blossoms, which at the shore give way to a soft carpet of buttercups. In the distance, across the straits, the amaranth rises in the bold outline of the Olympic Mountains, whose bases are of an intense blue, their tops white with perpetual snow. At the left so far as the eye can reach, stretches the green waters of the Sound, dotted here & there with fishing boats & steamers. The air above the water is full of white-winged gulls, lazily flitting close to the surface, or sailing on another's wings high overhead, at the right the coast line of the Island upon which we stand, curves gently, ~~the land in the distance~~ toward Cape Flattery a ~~rocky~~ dim misty headland just discernable in the distance. The whole forms a picture of green water, blue mountains & yellow blossoms.

May 17/08 I am sitting in the little cabin
of the steamship "Tess" writing on the
long table in the middle of the room.
We are tied to the wharf at Albernie,
where freight is being unloaded, &
will run from here back thru' the
"Albernie Canal" to the Sechart and
the whaling station. Outside the rain
is falling in a steady, monotonous,
drizzle which has never cleared since
it began early this morning. The
cabin is cold & only lighted by three
small electric lamps, and the
situation is anything but a pleasant
one. After passing Cape Flattery
about nine o'clock this morning,
we ran full into the face of a
tremendous sea, which came in
from the open Pacific with no
land to break its force. The little
ship stood the blows of the gigantic
waves magnificently, wet rolled
& pitched like an egg shell in the
water. At first it does a beautiful
& inspiring sight to see the ~~the~~
great waves break with terrific
force against the vessel's side,
throwing spray high into the
air & soaking the decks. ~~The~~

I stood on the deck amidships shielded from the water by the little deck house, watching the great waves as they chased each other astern, curl & break in a shower of foam of an almost emerald green. For a time it was enjoyable and I thought I would not be sea-sick, but as we got further & further out into the open ocean & the size & strength of the waves increased, I found that every time the ship climbed up ~~steps~~ to the top of a great corner & plunged down on the other side, the pleasure grew less & less. I stood at as long as I could & then beat a retreat for my stateroom where I learned what it was to be sea-sick. Every time the ship came down from the top of a big wave, I seemed to leave my stomach up there, to follow along on the next white-cap. To say that I was sick is putting it mildly; I didn't care whether the ship went to the bottom or not - in fact I rather hoped she would. However about one o'clock in the afternoon when we left the open Pacific & got into

the sheltered waters of Barclay Sound,
the ship stopped tossing and I feel better.
Tonight I am all right again but a little
weak around the region of my belt, &
not wanting to eat very heartily.

May 20-'08 we reached Sechart on the morning of
the 18th about 5:45, in a drizzling rain.

The whaling station consists of a group of
^{dusty white} buildings jammed up against the
foot of a mountain, which rises about
three hundred feet behind it. In the
center is a long wharf, at the right
side of which are the sheds for cleaning
& storing the whalebone, the glass covered
tanks for bleaching the oil, and be-
hind these the superintendent's quarters.
On the other side of the wharf and
is the great "slip" upon which the
whales are pulled & stripped of blubber
the engine house & the tanks for
extracting the oil from the flesh
& blubber. Also the drying machines
for making the flesh into grans
& the bone crushers are here. Behind
& on the hill are the quarters for
the different gangs of men, the several
gaps & chimneys.

May 21-'08 The weather has been very bad, & it has
rained every day since I reached here,

The "Oriam," the whaling vessel, was in
at the wharf when I came here, & left
early the next morning May 19. She
has not returned as yet but will be
in tonight or all probability. When
the weather is thick or there is much
sea on, she does not venture out
as it is practically impossible to
kill many whales.

no. I sex ♀ Date May 22 - '08 Sedent, B.C. 23

Humpback

Whale No I Color

Back, tops of head & sides deep blue black,
~~the black of the sides~~ On the throat streaks
& splashes of white which run well up
under the pectorals. A few small
white flecks & circles of white along
both rami of mandible - Less white
on the breast than on the throat & still
less on the belly - The circles of white
show on throat to some extent; flecks
& patches of white about genitalia, &
on the inner edge of the peduncle to
the flukes. The mucous membrane
on the roof of the mouth is flesh col-
ored, except at the extreme posterior
end where it is black.

The right pectoral has the inferior sur-
face entirely pure shining white except
at point of insertion where a large black
patch encircles. A mass of black
flecks are in the center of the flipper
opposite the widest part, which is
about at the end of the first or third
There are 12 or 15 rings & spots of black
on the under side irregularly distribu-
uted, the rings look like this

External Characters

External characters

On the top of the head there is a double line of prominent knobs alternating & running from the tip of the snout to a point opposite the blowholes. On the median line from the ant. end of blowholes a line of knobs runs to the tip of the snout. The eye has a deep furrow above & below it - The ear is a small opening large enough to insert a small lead pencil.

From the post. border of the dorsal fin to the flukes, the top edge of the peduncle is gently crenulated.

The dorsal fin is small & looks like this

- blunt
at the top & rising in an even regular
slope to the tip. Midway between the
pinnae & the flukes on the inferior
edge of the peduncle are several
deep notches or creases -

The tip of the upper or rostrum is fairly pointed; about like this / .

The tip of the lower mandible (symphysis) is

blunt & rounded & a mass of irregular
knobs, one to three inches in height, these
knobs are all thickly covered with
parasites - barnacles & Cyamus. There
are approximately 20 furrows on the
breast - I couldn't count each one.
The pectoral on the anterior edge has
7 knobs all covered with barnacles
& Cyamus.

The baleen of both sides is
a deep ~~black~~ black in color, with a
brownish tinge when reflected in
the sunlight. On the inside the baleens
are very thick & long. ~~From the~~ From the
front to the back of the baleen - row a
broad band of dirty grey ~~grey~~ about
18 inches wide ~~extends~~. This
greyish band begins at the bases
of the baleen plates & extends up-
ward about 18 inches - the plates
thence to the tips are very dark
brown or black. ^{The margin of this band is very sharp.} As the plates
of baleen become shorter toward
the anterior end of the row more
& more of their length is accom-
panied by the grey band until
all the plates of the anterior
portion of the row are grayish
even to tips. The inner ^{(supporting) edges} edges of

the greater portion of the baleen plates are streaked to a greater or less degree with white to varying degrees - some have nearly half the plate white, & streaked, & others but slightly or not at all. These streaks run longitudinally, ~~where~~ The white streaks seem to always be on the inside (whale bearing) half of the plate & cannot be seen from the outside.

This whale contains a small foetus about 2 inches long.

Since the whales are all blown up as soon as killed the circumference must be only approximate - however I have allowed ample for this swelling in taking this measurement.

The flukes had been cut off before whale was turned out but the small part remaining showed the under surface white & alone black.

The baleen extends in a thin line entirely around point of snout thus connecting the two sides.

Humpback

Whale no. 2 May 22-08 Sechart B.C. J

Color Back top of head & sides deep blue black - much white on chin & throat taking the form of streaks & splashes, The white is heaviest in the median line & this, which extends in a V shaped mass down to the breast - it ends ^{in the center of the breast} at a scar which looks much like the navel - below this scar & on the belly there is but little white - only a few scattering streaks - there is little white on the sides below the pectorals except in the median line of the breast - There are a few white circles along the jaw bone, but not a great many. There are specks & dots of white from the penis nearly to the insertion of the flukes on the upper ^{edge} median edge of the peduncle. The inner side of the lower lips are blue black, but a shade lighter than the ant side - 2 small blotches of white were present on inside of lips - The skin of the tongue is much lighter than the lips - a beautiful blue gray - this membrane look exactly like crepe paper.

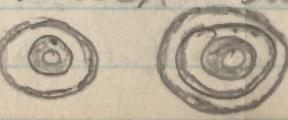

The circles of white were mostly confined to the region of the jaw bones in both whale -

The penis was flesh color - there is much white about the genitalia. The flukes had been cut off but the inner side of the stamp was white - alone black -

The mucous membrane of roof of the mouth is a light purple with small black flecks - at the entire posterior end of the roof of the mouth there is mucous membrane is black this black area had the same shape in both whales & was about 1 foot in length

Pectorals

The right pectoral on upper surface is black - toward the tip along both margins the white streaks & circles encroach on the black upper surface. For one half its, distance (from insertion) this is now white except along the thick anterior edge. The under surface of this flipper is black ~~foot~~ thickly circled with white for the third of its length nearest the insertion. The remaining $\frac{2}{3}$ ds to the tip has a white background circled with black - the circles are like this

The left pectoral has 8 bunches on the thick anterior margin - the right pectoral has seven. The first bunch is largest in all species - these bunches are all thickly encrusted with barnacles & infested by *Cyamus*. The posterior margin is thin (about 1 inch thick) & rounded - it is only slightly crenulated, particularly toward the tips - the tips of both pectorals are absolutely covered with barnacles.

External Characters

The roof of the mouth is about six inches wide at the tips between the plates of palæon & flat - On either side of the median line are two large folds - the ant end of these folds are lined longitudinally with fine creases - passing toward the throat the median line of the roof of the mouth begins to raise in a gradual slope till at the posterior termination it ends in a ridge 18 inches high - going backward the distance between the bases of the palæon rows becomes greater & the

roof of the mouth is thick widened. The rhinoline extends in a thin line around tips of jaw meeting & joining the two valvular mus in front.

On the top of the head there is a double line of knobs running from opposite the blowhole eminence along the margin of dorsstrum on either side to the tip. These knobs are for the most part alternate. Also a line of spines from ant. point of blowhole to snout - There are 29 of these knobs on tops of head - 13 on ~~left~~ right side of head & 14 on left.

From dorsal fin to pectorals the superior edge of pectoral is gently emarginated - the edge here is about $1\frac{1}{2}$ inch thick & rounded. The pectoral is very narrow, at insertion of pectorals, both laterally & longitudinally - The dorsal fin in this whale is low & of this shape  The fin does not run evenly to its tip as in the other but has more the form of a hump - The symphysis is like the one, a

bunch of knobs - just below the symphysis is a deep depression ^{or notch}, then the chin bulges out - at this bulge the barbules are especially thick.

Exactly midway between anus & insertion of flukes on the inferior edge of the peduncle is a prominent round hump - I did not notice this in No 1, - also there are numerous ~~laterally~~^{deep} transverse creases or furrows on the upper margin to the flukes. Just posterior to the anus there is a decided notch in the peduncle, making the whole outline at this part look like this.

The throat folds are wide and ~~most~~ many of them divide in the throat just ~~be~~ ant. to insertion of pectorals - they are wider on the belly at its posterior end - here are measured 19 cent. - there were 18 furrows in throat, ^{which} are about $1\frac{1}{4}$ inches deep.

Humpback Sex ♀No. 3 May 23-08 Sergeant P.C.

Color Both sides & belly black - little white on throat, but on breast in median line opposite insertion of the pectorals there are several large patches & many streaks. On both rami of the maxilla are numerous rather faint white circles & half circles. There are no circles or white from eye to insertion of pectoral, & none on belly back of posterior insertion of pectorals.

Mucous membrane of roof of mouth light salmon-purplish strongly marked particularly along the median line, with dark olive-green streaks. The large patch at posterior part of roof of mouth where it passes into throat, had the same shape as the others but was of a bluish green color. The inner side of lips on left side was greenish-black & on right lighter mixed a grey-green & spotted with darker Pectorals.

— Right: inferior surface from insertion for $\frac{1}{2}$ length black, rest white except at tip which is black - the no black parts are circled with white & the white parts .. black

Superior surface most all black
heavily circled with white & white
of its chiefly toward posterior edge
an anterior $\frac{1}{2}$.

Left pectoral above black circled
with white toward tip & posterior
edge, white circles on thick
anterior edge of both fins.

16 Bunches on right pectoral

7 " " left "

The thick ^{posterior} edge of right pectoral
slightly circulated toward tip for
about $\frac{1}{3}$ of its length - bunches all
covered with barbs & Cyamus on
the tips - Right pectoral is 27 c
thick at head of radius - left is
24 c.

Baleen, the baleen has the same
band of duty grayish-white bristles,
about 1/6 circles wide, as all the others
have had - the remaining part of bristles
to their tips are brownish; all the
bristles of the plates on the anterior
half of the baleen rods are duty
grayish-white with sides same.

External Characters

The dorsal fin is falcate + higher than any of others - its slope is quite different from 1+2. There is a decided dip in the anterior portion so that the gradual slope to the tip is broken - it is like this

The upper edge of peduncle from d. fin to gills is but very slightly crenulated - just wavy. I did not notice about bunches on lower edge of peduncle.

Same double line of bunches on edge of tops of head as in others + some bunches back to summit - these alternate usually - bunches begin opposite the branchlets - There was a large scar effect behind branchlets on sides. There were 18 bunches on right side of tops of head counting stem in median line. The ~~smooth~~ symphysis of mandible was knobby as in others - The throat folds extend to near as belly in median line,

	cent.

The circumference of this whale could be determined very well since it had not been blown up - (no 4 had " " up)

The ear has an opening at the top about 1 cent. in breadth but ^{and} the real opening at the bottom would not admit ^{upright} the end of a small lead pencil. - The eyes in all the whales had a deep crease above + below it like this 

The slit for the teat is a V shape same as the for ear - the slit at top is 17 cent wide, + the mass teat is nearly as large round as my thumb + flesh covered - The mammae lie exactly along side the genital opening - ~~at~~
The flukes were cut off but the notch was V shaped + not very deep; shaped like this

Humpback

No 4 Sex ♂ May 23-08 Sechart B.C.

Color Top of head, back, sides & belly black - whitencies about on both rami of maxilla rather thinly distributed - ^{very} a few of these circles run down on throat for a short distance chiefly on the sides; most of white of throat & breast is in streaks & flecks which are small; in the median line of breast between the pectorals the pectorals is a large solid, pure, white spot. The white on the throat & breast is mostly confined to the median line - posterior to the pectorals ^{to the anus} there sides white except for the faintest tinges along the very edges of the fold ^{most of the fold are edged with a thin white line}. From the chin to within 2 feet of the anal, consisting of the flukes on the inferior edge of the peduncle there are fine specks & flecks of white thickly scattered - hardly any white about the penis slit, but this portion is heavily encrusted with barnacles - From the chin to between the pectorals on the median line of the breast there is a solid band of barnacles about 100 or 120 inches wide. (See photo) - Stomach & lobes white below, black above.

Pectorals

Right pectoral black ~~—~~ on superior surface with a narrow white band running obliquely across at the tips - the anterior half of the posterior (septlets) edge of the fin is thickly covered with small white circles - also the tips. The thick anterior edge of the fin to within a short distance of its insertion is white.

The inferior surface of this fin is pure, shining white for its whole extent, save for a black patch at the point of insertion. The anterior and third along the tip & posterior margins is thickly circled & spotted with black - There are 7 bunches on anterior margin of this fin.

Left pectoral black alone, strongly contrasted with white along tips & posterior margin - no white on the $\frac{2}{3}$ of the upper part of body - anterior margin white. Below fin is white, circled with black toward tip & edged with black. The posterior margin is strongly crenulated toward tip on both fins. Seven bunches on anterior margin of this fin, all covered with black circles.

Part of the mouth light salmon -

of paler
duty

purple, & bristles, greyish-white same
as in others.

External Characters

Same hump on superior edge of peduncle exactly midway between anus & flukes as in others. - This hump was seven times higher & shaped like this

Peduncle, superior edge, from dorsal fin to flukes strongly crenulated — irregular — Dorsal fin foliaceous & shaped almost exactly as in no. 3 with same dips at anterior base & Synphysis ^{of mandible} all humps same as others — same budge of chin just below synphysis as in no. 2 —

There are 16 humps on right rami of mandible — none go on throat — these humps are not as large as those on top of head.

There were 11 throat furrows on the right side from eye to median line of breast. This is complete. That there must have been about 22 furrows altogether & could not get at other side. The folds divide for the most part about ~~middle~~
between pectorals — they are widest at posterior end, & at chin where they

curve in to end. (or begin) Funnels
are about one inch deep + the
same in width - their bottoms
are finely creased + same color
as ~~top~~ flesh - folds have rounded
edges + flat tops - One deep crease
or funnel runs up over pectoral
at shoulder - four other short creases
run half way up on pectoral at
posterior insertion - One wide fold
runs from corner of mouth to
anterior edge of pectoral.

Twelve knobs ~~on~~ left side of top
of head counting median line -
same arrangement as in other
specimens.

Blubber about 11 cent. thick -
whitish yellow in color.

Seschart B.C.

No 5 - Humpback sex ♀ May 27-08

Color Back, sides & top head & belly black - much white on throat & breast to insertion of pectorals thickest in the median area; the white here is mostly in streaks & splashes -

Each ramus of the mandible, slantly toward the tip is, is practically covered with small white circles, which take every kind of pattern - some overlapping, some, heavy on one side & light on other, etc, etc. These circles are smaller than those on any of the other whales - Many circles extend on to the chin & some on the breast - scattering faint white circles on sides of penuncle from anus back to flukes - five white circles on sides of back just above pectoral - The funous are well edged with white - From the eye to the out. insertion of pectoral are many streaks & splashes of white - The burns or bunches on the right side of top of head seem to have been injured (the tips look as tho' they had been rubbed off) & are deep yellow. - Burns on left side of head are black (head dry)

Roof of mouth flesh colored - the

inside of jaw light slate-blue as is tongue

Partes Both factors & blast above white belly covered with black toward tip & posterior margin

External Characters See plate of dorsal fin.

Superior edge of peduncle wavy with shallow emarginations from a point opposite the arms to the flukes - two well marked furrows run up over the pectorals at insertion - blowholes look like this // - The blow holes are situated have their anterior ends at the highest part of the eminence in the tips of the head - between them is a deep cleft or sinus - the posterior end of the opening is the widest - a cleft runs beyond the end of the spine at both the ant. & post. ends - The eminence surrounding on which the blowholes are situated varies greatly in height; in some animals it is very prominent in others very low - the slope from the median line of the tip of the head is gradual like this -

The widest fold
post. in it is what
was on belly just at the posterior end.

(of eye dorsal fin lightly marked with
white)

It was 21 centimeters wide.

Baleen - The bristles of the anterior plates
are very white - those of the remaining plates
except the tips ^{duty} are grey - tips brown.

No. 6 Humpback Sex ♂ May 28-08 Sechart

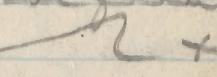

Color Top of head, back, sides + belly black - many large white circles are both rami of mandible which extend down on throat and chin half way back to pectorals; from here back to insertion of pectorals the white is confined to small patches & not many of these mostly in median region. Much white in fine specks from under to flukes, like pepper + salt. - On upper edge of peduncle of insertion of flukes there is a large yellowish-white spot - Slab of flukes black above. A large white transverse spot with ragged margins in median line of breast, a little back of insertion of first edges of folds strongly edged with white on breast - Roof of mouth light purple

Pectorals Left Pectoral below toward body $\frac{1}{2}$ black - $\frac{1}{2}$ toward tip white with sparse white circles - Both margins edged with black above black - few white circles along posterior margin -

Right pectoral - black above - many circles +

spots of white along posterior border thickest toward tip - and so are anterior edges - Below white - many dashes & circles of black - black on ant. edge & also on posterior edge in the anterior half & tip - Sticks of flukes慷慨 above -

Baloon Mouth grayish white -

External Characters - Dorsal fin only slightly foliate like ill.  + contracted at tips - only a very few bristles on left larmus of jaw - knobs on top of head begin opposite blowholes - one deep furrow runs up over base of pectorals - The ear in this whale small (5 millimeters) - I find that this varies in different individuals to a marked degree - In some (like this whale) the ear is only a small elliptical opening just outside in a depression - in others it is a bottom of V depression elliptical or round at top - ~~the~~

The eye has a deep furrow above & below it curving around it; the eye is situated above & a little forward to the corner of the mouth. Top of peduncle only slightly crenulated. Only a slight bump on lower edge of peduncle between scales & flesh.

Humpback

NO 7 Sex ♀ May 29-08 Sedan B. C.

Color Back, sides, belly + top of head black
 The white areas on right ramus of mandible large, faint + mostly toward symphysis - On left ramus there is a splash of white midway between ~~top to~~ corner of mouth - behind this no more white - in front of it to tip more splashes + a few large circles - white does not run up on lips at all - only on ramus. Small streaks + splashes of white from tip of snout on throat, rarely to opposite pectorals in median line - a few scattering white circles on sides of chin - From pectorals back in white on breast or belly except a very very few small white flecks along the edges of the folds - almost no white at all - On nasel actions. very white spot about 2 in. long + a white streak posterior edge of nasel 6 in. long. - from arms to flukes on inferior edge of peduncle many fine white dots + freckles, "pepper + salt" - very little white about genitalia - mostly in fine specks + dots - The base of flukes black below -

Pectorals Superior surface of left fin black - a few white circles + spots along the posterior edge + toward tip

but not many - anterior edge of fin
mostly black with circular patches
& splashes - inferior surface of
left pectoral has a large black patch
on the hind part of its length, near the
body; this patch does not extend either
edge. Rest of fin white with black
circular spots & streaks toward tips.

The center third of this fin is almost
without spot or mark. 8 numbers on it.
The right pectoral is almost exactly
like the left - in coloration on its
inferior surface - alone it is black
at the $\frac{1}{2}$ of the fin toward the tips which
are black along the posterior edge
getting darker toward the tips which
are covered. 9 numbers are anterior
edge

Posterior mouth, ^{very} light purple

Balens - The borders at the extreme
bases of the plates are brown - then
white in the middle of the balen row
for a space about $\frac{1}{2}$ ft. wide, then
brown at tips. The oblique sides
gradually mix the white to both
ends & tips. The balen plates
themselves are black streaked with
white to a greater or less extent
the streaks are always on the side while

bears the bristles & don't show from
the outside.

External Characters

12 besides bunches on the right ramus
of the mandible, toward superciliaries
mostly

16 knobs on the top of the head
right side including the median line
from the mouth to tips.

The bunch between anus and fishes
on upper edge of peduncle is very
prominent & is 20 centimeters high -
The superior edge of peduncle from
dorsal fin to fishes has no even
incisions - a straight line - The
notch on chin deep & bunch large -
(See photo of dorsal fin)

No. 8. Humpback Sep 3 May 27-08 Sechart B.C.
Color - Back, top of head, sides & belly black - no white on belly, but even edging to folds or on the sides of the breast - the white on the median line of breast extends to the pectorals; the last half way only a little. The white on the breast & median line of breast occurs in circles, flecks & splashes - the white in median line of breast to opposite insertion of pectorals is in small patches. From navel to penis is a line white - small patches - from penis to finbase "pepper + salt". Under side of stub of finbase black - anterior margin white - penis yellowish white - Roof of mouth light copper flecked with olive green mostly in median line - insides of both rami of mandible slate blue as S. tongue.

Pectorals Right, superior surface, all black, no white circles but many bony scales along posterior margin - Dorsal surface white, except at body with

a little black at tip & along posterior margin near tip.

Left Pectoral is black alone - under side much like No 7 (See photo) a large arrow-shaped black patch extends out from body not touching either margin, far on third length of fin - rest of fin white both edges black - (a large white scar on left eye)

Baleen Bristles of baleen all steel gray even to tips, except the anterior portion which is white - the short plates of the very anterior portion of the baleen row are all white, showing from out side (see photo of head)

External Characters

13 low knobs on left ramus

16 to 18 high left side

The bunch on the chin is very prominent + the depression below it a little deep - Many barnacles on throat folds - This whale is blown up so that the furrows between folds on throat + breast are in some places nearly 10 or 12 inches wide - The furrows are $\frac{1}{2}$ inch deep (deeper than most of the others) The folds would normally lie about $\frac{1}{2}$ inch apart - greatest division of folds is on the breast near junction of

pectacles, for the obvious reason of allowing for the swelling the body at due place. The folds do not divide to a great extent - only a comparatively few - they expand of course both at beginning & end. The folds lie flat on top with rounded edges - 2 furms run up over the wrist. By the furms on the right side. Bottoms of furms are of same color as tops & finely creased show by that it is expanding tissue.

The tongue of these whales extends close to the tip of the upper jaw & completely fills the space between the rami of the mandible. This whale was lying on its side with its mouth slightly open, and I crawled well in inside this getting a good opportunity to see how it lies in life. It is a loose flabby mass of blubber & flesh, & when taken out has no definite shape whatever - it simply lies flat on the slip. The skin which covers it is slate-blue in color & looks like nothing so much as coarse crepe paper. It is therefore very elastic & can be pulled into almost any shape! On the mouth the tongue is held in shape by the

jaws & throat completely filling the ~~the~~
inside of the mouth. The ends of the
balenae apparently fit down on either
side & the tongue accommodates itself
to the space between the rows.

(See pl. I) The tip of tongue is like this

The top edge of the peduncle is very
slightly crenulated

The excrement of these whales is
about the consistency of thick cream
& is brick-red in color - when
drawn or let slip & out into, the
air with which they have been blown
up forces out the excrement, which
is sent forth in a thick stream
& sometimes thrown eight or ten
feet from the animal - its odor
is very disagreeable.

The stomachs of all the whales so
far have contained the same sort
of food - shrimps like annelids, from
 $\frac{1}{2}$ to $\frac{3}{4}$ of an inch long & occasionally
a few worms, very much like earth
worms. The stomachs all contain a
great mass of this food in all stages
of digestion, * mixed with a dark
maroon-red fluid the whole making
a mass about the consistency of thin
cream, when the stomach is first

opened the stench arising from it is almost overpowering + for a few moments makes close examination an impossibility; the contents however run out upon the slips & may then be easily examined.

 notch of flukes deep + shallow like this
 with excurrent margins ——————
 flukes on top of head begin opposite
 the blowholes - this is one furrow above
 + one below the eye 23 cent. long - they
 curve around the eye.

M. 9 Humpback J May 27-08 Sechart B.C.

Color Top of head, back sides black - belly & breast back of pectorals black with the exception of four white streaks in the bottoms of the furrows - no more white back to finis - This is the first whale on which the base been white in the bottoms of the furrows. Peduncle, inferior edge of lower fin with flecks "pepper + salt" - On median line of throat between pectorals is a transverse white blotch with ragged edges, 18 inches longitudinal dia, by 3 in. cross diameter. This is like #81 on No. 6 whale. The white ends on both rami of mandible are mostly toward the symphysis; these run down on either side to median line the white on throat extends immediately back for about six feet then runs from here to the white spot opposite the pectorals on median line there are only small flecks of white -

Peris from base toward tip for 2 feet brownish black - then flesh colored to tip -

Pectorals Left - black above the post. ^(Circled) anterior margin white & thickly studded with barnacles - ant. margin same. Below large black patch at insertion

running off at posterior edge - both edges black & rest of fin white, the center streaked. Right pectoral practically the same in coloration. 7 knobs on right fin; 8 on left fin.

The inner skin of the gills is sky blue - roof of mouth light purple shaded with white base of roof of mouth slate blue as is tongue & mouth of both rami of mandible.

Baleen Bristles steel-gray at base for 4 inches then grey white to tips - At anterior and third by row, the bristles are white. The entire plates, bristles & all, are white for 30 cent from tip.

External Characters

13 knobs on right ramus of mandible - top margin of peduncle very slightly elevated, faint wavy - The bluish tinge over amus & flukes, lower edge peduncle, is prominent - great mass of bony scales on throat - Dorsal fin almost exactly like no 8

no 9 ♂

No. 10 ♀ Humpback June 1 - 3 & Sechart B.

Color Top of head back & breast black - red
white whatever on belly or breast back of
pectorals to genitalia - a very extensive
about genitalia - almost white, in
an left ramus except at tips, but a
number on chin which run down an
to throat - the white on left ramus is
all forward to one meter from tips;
back of it - much white on the anterior
end of right side of throat chin - circles
& in the very center of throat running
nearly to the anterior insertion of pectoral
A few long streaks of white in the bottom
of the furrows just back of pectorals
Just a dash of white from alveus to flukes
and lower edges of fuscuncle - inferior sur-
face of flukes black - Roof of
mouth lighter purple except at tip where
the center is white - spot on back of
roof of mouth blue green - inside of ramus
of mandible dark slateblue as is tongue

Pectorals Left - below, black at insertion for
 $\frac{1}{3}$ its length then all white - black spots & rays
& circles at tip - both margins black -
above black, thickly circled with white
along posterior margin & at tip

Baleen Bristles most all dark brownish
gray except the outer longitudinal
band of lighter gray - all the bristles are
light gray at the anterior part

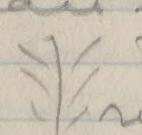

External Characters

18 white hairs / cent. long on extreme top
 of symphysis of mandible - a deep crease
 runs back to travel from vulva - a
 deep slit on either side of the mammae -
 the folds are 17 cent. wide at mid (part.) - tips
 of peduncle only slightly crenulated - many
 deep scar-like transverse creases on folds of
 throat & breast back to pectorals - Blubber
 1.4 cent. thick - 13 blisters on right side, tops
 of head (counting center line from blowholes)
 no hair anywhere except at symphysis - hump
 between arms & flukes prominent - a very
 abrupt dip in outline of peduncle just
 back of vulva - Dorsal fin like this 
 The mammae are in front of the center of
 the vulva just 17 centimeters - This whale
 had a foetus about 8 inches long (no 12)

The opening of the ear in the subdorsal was very large at first & elliptical of its usual shape enough at bottom to enclose a small penicil.

no 11 ♂ Humpback June 1-08 Sechart B.C.
Color. Top of head back & sides black - The
 median line of breast & throat from
 snout to opposite pectorals is all
white streaked with long & narrow
black marks pointing obliquely toward
the median line - from both sides
like this  The white in median
 line only runs back of pectorals
 to anus & here it is only in dashes
 & flecks - On the sides of throat &
 breast, the white median line gives
 place to the black of the rest of the
 body, but it is very strongly dashed
 with narrow white streaks all point-
 ing obliquely toward the median line -
 The white of the breast does not run
 up to the ramus so there is an
 area here not very heavily marked -
 Right ramus of mandible is heavily
 circled with white, but from the
 beginning of the downcurve of the
 mouth - on all sides back to the
 fishes no color except the faintest
 traces of white in the bottom of
 the folds where they end. From
 navel to penis little white and many
 barnacles - grayish about penis &
 from anus to flukes, the lower edge of the
 peduncle is white & "pepper + salt" - Roofy

mouth light purple - base slate-blue
 - tongue - inside left ramus very
 light slate, almost white - left darker
 slate -

Pectorals Right - above black, except at
 tip which is white + black, & looks as
 tho' flour had been dusted over it -
 Left white below, tip + pattern margin
 edged with black - and margin white
 except at bunches which are black -
 a row of semi elliptical spots in center
 of fin running across it - 6 run in
 same manner ~~near~~ ^{near} end - Top surface
 left pectoral black except at tip which
 is whitish same as right -

Buccal - Bunches of antenn $\frac{1}{3}$ or more all
 grey-white - rest have bases steel gray
 the usual central band of lighter gray,
 + the tips brownish-gray & the scales all
 else merge perfectly into one another -

External Characters On the right side of
 body 4 feds run straight through fin
 from tip to end, without dividing - 1/2 short
 white hairs on the very top of mandibular
 symphysis .05 cent long - Dorsal fin
 low + almost exactly like No. 0 - Top of
 peduncle well constricted - no hair on
 chin whatever - 4 vs hair on top of head -
 1 cf bunches top of head one side - many
 barnacles - one narrow extends from

The corner of the mouth up over the insertion of the fectoral.

Eye Four furrows above & below curving around eye - furrows are 20 cent. long. These ends stand 8 cent. apart both anteriorly & posteriorly - from ant. corner of eye a crease 6 cent. long runs forward & one behind - lids thin - pupil black & iris brown, surrounded by a ring of lighter; then comes a ring of dark brown 1 cent. wide - the eye is situated 22 cent. above the corner of the mouth & 15" behind it.

Ear - Very small .05 cent. + has adpression-guttan ellipticas hole -

No 12 Humpback ♂ June 1-08 Gedrait B.C.

Color Tip of head white, back all black - back
of the pectorals all the fields of the belly
have white edgings. - Scattering white
circles on breast to pectorals mostly on
the sides - median ^{of throat} white spots -
from the middle of the breast to the pectorals
is an almost solid line of white - 7 fair
white circles about eye - penis to flukes
~~is pepper + salt~~ ^{is} ~~is~~ ^{of mouth} salmon purple fleched in median line with
greenish-black - base slate blue as is tongue
& inside right ramus ^{of mandible} left ramus
whitish in central area - white patch on
underside of tips of rostrum - many
white circles on outside of right ramus
& mandible. Below the skin of the flukes
has a large white spot on the right
side - on the left side, it is shaded
streaked with white.

Pectorals - Above, right, black at insertion
& in center nearly top - a large white
band extends from tip along anterior
edge to insertion - the white fin
much circled & washed with white -
Other surface this fin has a long
black patch in center from body
for $\frac{1}{3}$ distance - rest white, circled
with black on both margins.

Baleen - Bristles have backs all steel gray
the rest of antenna is all white - the points

one-half has bases steel gray & tips brownish gray; between tip & bases bristles are gray white.

External Characters - 24 hairs on very tip of snout tip - widest fold on belly so cent. at end - large bend between flukes & amus on lower edge of peduncle - a deep V shaped cut on the posterior edge of the left pectoral about the middle - tips of finnecle only crenulated slightly - 7 hairs on very tip of rostrum - 16 hairs on right side tip by head (counting ventral line) great mass of barnacles on throat no hairs on any other portion of the head or body

no 13 Humpback ♂ June 1 - 08 Secular BC

Color Back sides of body + tip of head black -

On right ramus of mandible many large white circles running from tip of snout to the back within about 4 feet from the corner of the mouth - they go up clear to the edge of the lips - Left ramus, circles extend to edge of lips but are not quite so white as in right. On sides of breast between pectorals & snout is a great mass of white dashes pointing obliquely toward the center - this mass of white runs up on the sides of breast not quite on a line with the insertion of the pectorals (see photo). The white is heaviest in median line opposite pectorals, ^{where it is almost white} & extends back half way from fins to navel - it is dashed like with narrow black streaks - Many barnacles on chin which somewhat conceal the white here. From pectorals to flukes the bottom of the ramus is thickly peppered with white - There is a rather small white patch directly behind the left eye - There is a fine anterior edge on the dorsal fin to the tips & a very little on the posterior edge - Body of mouth delicate pink or flesh-color - base blue-green - Tongue & inside of right ramus of mandible bluish slate - left ramus a little lighter - There is a

white patches on the left side of the tips of the rostrum underneath - also on right. Pectorals left below all white except a small black patch at insertion & at the very tips - above black heavily streaked with white along posterior edge & at tips - ant. edge mostly white.

Baleen Base of all bursers steel gray the rest of the antens one half of baleen rows have bases all white to tips the posterior one half have bases steel gray, middle light gray & tips brownish.

External Characters

25 hairs white on tip of symphysis - 6 hairs on the 6 bristles on the anterior part of right side of tip of head - no hair on brain - dorsal fin like others but low - peduncle well crenulated - Lips under edge are rounded evenly - 2 furrows from corner of mouth one running above base of pectoral & other below it - ~~The~~ 14 cent from tip of rostrum to beginning of baleen

No. 14 ♂ Humpback June 1-08 Sechart B.C.
Color Back, sides, top of head & belly black-fus
 pectorals to finik there is no white - on
 both sides of the pectoral just anterior to the
 mouth of the fishes there are a very few
 faint white circles - a few other circles
 on the stellate the pleure (beneath) which
 is black - extreme tip of dorsal fin
 is white - just a tiny on the edge -

On the ramus of the mandible,
 there are many white circles; these ex
 tended upward on the lips to the ex
 treme edge & back to the beginning of
 the dorsal curve of the mouth -

The white circles run down on the
 chin - throat, back nearly opposite
 the pectorals - the white on the throat
 is not heavy & is almost all in
 circles - few patches or streaks -
 a few bands on chin & almost
 penis; also on hump between flukes
 & anus below - The tongue of the
 whale is out of the mouth showing
 the insides which is light purple -
 above it is slate-blue.

Part of mouth light purple shading
 into yellowish blue just before the
 bare patch which is evergreen.
Pectorals Left, below (supplcts) has
 a large black patch at insertion

The right fin above is black thickly spotted with white circles from body to tips.

for $\frac{1}{3}$ its length, which touches posterior edge but not anterior - along the posterior edge blackish & black at tip also. Black patches about center of fin near anterior margin and edge black & white -

The underside of the right fin is like the left -

7 banded ant. edge right fin

6 ... - eigt "

Bateman. Bristles dark gray at bases
the extreme tip of the palerini $\frac{1}{2}$ likewise.
The remainder & all the anterior bristles
are white - I believe the bristles of this
which are the whitest I have seen yet.

The number of baleen plates was 320 of which the first 65 in the rows are all more or less whitish or slightly grey, the
Besides these 65, 180 other plates were streaked
These streaks were all rather light & all
^{plains of the} in the exterior (probably the rows along
the inner (breast) baleen) side, at the
bases.

External Characters

The bunch on lower edge of peduncle between flukes & arms is very high & gives the peduncle quite a whale a peculiar stubby appearance. - The top margin of the peduncle from dorsal fin to flukes is not very heavily

crenulated - dorsal fin is like others
 of which I have plates.

Notch of flukes deep & posterior edge heavily
 crenulated - notch like this —

A deep furrow runs from the corner of the
 mouth up over the base of the pectoral fin
~~to~~ to a little beyond the posterior edge &
 then steps abruptly - another runs
 from corner of mouth to anterior edge
 & a little underneath fin, then ending
 abruptly - These two furrows seem to
 be constant in all the whales I have
 seen - the extent to which they run varies
 a little.

16 knobs on top of head right side
 counting median line from blowholes
 to tip of snout - There are six knobs as from
 blowhole to snout - a convex line of
 9 knobs run from tip to opposite blow-
 holes on edge of rostrum ^{versatilis} - This would
 make 25 knobs altogether on top of head -
 There is one knob just in front of blow-
 hole between the center line & the side lines.

Each knob in the center line has a
 white hair in its center at top set in a
 little pit or depression; these hairs
 project .08 cent above surface & usually
 may be easily pulled out - when pulled
 out they are about 25 mil. long - four

holes in the lower sides rows bear hair & the single knob between center & side lines has a hair - They There are 25 white hairs on the extreme smooth tip of the mandible
~~at~~ synphysis.

The bunch of the chin is very prominent & about 7 inches high - the depression between it & the synphysis is deep & in the bottom of this depression there are six deep creases of varying lengths. On the right ramus of the mandible there are several bunches of varying sizes six of them bearing hairs.

In the median line the folds of the throat become greatly narrowed and meet the bunch of the chin in a series of V's as in the other like this. This arrangement of the folds is

most frequent
the pectorals
the greatest

common to all
from between

forward to the front

number of the
folds divide, & become much narrower
the folds back of the pectorals are at
least twice as wide as those in
front of them - four folds on the
whole body run from snout to nasal
without dividing & none of them sheep
a constant width throughout their entire
extent - only 2 folds wide back of the

pectorals except just at the naval
 to make room for this organ.
Peduncle Thirty cent. back of the posterior
 insertion of the penis its an elliptical
 opening 17 cent wide at the top, and large
 enough to insert one's finger - the top
 opening is 6 cent. deep & there ends - I
 take it that this is the rudimentary
 test of the male. The tip of the dorsal
 fin is directly opposite this cavity
 or 30 cent. back of the post. insertion
 of the penis. The middle dorsal
 fin is here opposite to the center
 of the penis - 24 cent. in front of
 the other is a transverse furrow
 30 cent. long. This crease marks the
 begining of the peduncle - I count
 up this crease or furrow the belly
 swells out to form the penisbulge
 which is prominent in all these
 whales - behind it the peduncle narrows
 gradually to the flukes, its outline
 being broken 84 cent. behind the
 arms by the rounded humps or bunch
 common to all this species - below
 the lateral expansion of the flukes
 the edge of the peduncle is bent about
 midway between the rectal and
 ant. edge of the flukes. Above

from the dorsal fin back, the edge of the peduncle slopes rapidly downward to the flukes - the edge is usually crenulated more or less. The edge of the peduncle is lost on the flukes about a little posterior to the middle - somewhat further back than below - The center of the anterior edge of the flukes at midrib of body is 43 cent from the top edge of the peduncle - It is 33 cent. from the posterior edge at the same place. The center of the bumps on the inferior edge of the peduncle is 84 cent, from the anus and 196 cent from notch of flukes - The peduncle is 27 cent. wide just in front of the insertion of the flukes which is its narrowest place - The edge of the lower lips is 7 cent thick + rounded.

The nose is a rounded bump 5 cent high + 27 cent long. There are 2 short furrows behind + 1 in front of it, but they do not meet each other in either nostril - - it is situated in median line of belly at the end of the furrows. The tip of the upper jaw or rostrum is 11 cent from the beginning of the whalebone - its edge is thick & rounded.

Gradually down to whitish tan -
 Eye - The eye is 25 cent above + 40 cent
 behind the corner of the mouth - the
 furrows above + below it are 24 cent
 long + curve around; anteriorly the
 ends of the furrows about the eye
 are 6 cent. apart + posteriorly the
 same - The crease from the
 ant. edge of the eye opening is 7 cent.
 long - its crease behind eye opening

No. 15 Humpback ♂ June 24-08 Sechart B.C.
 Color Back, sides top of head black - not much
 white on breast - white cercles on rami of mandible
 but not heavy - very few white cercles on throat,
 (in median line mostly) & almost none on
 breast - There is a white blotch on right side tip
 of rostrum underneath - (a white patch on one
 or both sides at this place seems to be pretty
 fairly constant in all the Humpbacked hump
 examined)

Roof of mouth pink - base slate blue as tongue
 & inside of right ramus of mandible - tip
 of left ramus is light blue

Pectorals Left, below, has much black on insertion
 not bordering ant. edge which is white for whole
 extent - post edge black to tip - fine & heavily
 mottled with black & white especially near
 body - Right flipper below is same as left
 Both edges of dorsal fin have white on
 them - white between pectorals & along
 inner edges both sides -

Baleens Bristles at bases dark gray - the
 tips of whole row are light brown - between
 bases & tips bristles have the longitudinal
 band of lighter gray - The general effect
 of the bangles at a little distance
 is rather dark -

External Characters

6 bunches on ant. edge of left pectoral -
 about 20 white hairs on symphysis on tip.

dorsal fin is falcate - five bunches on
the right ramus have hair on them - only
one hair on each bunch - thickest blubber
16 cent. - There are 11 knobs on the
right ramus altogether - Top edge of
the secundaries is well crenulated
perfinde is 35 cent. thick at union
of flukes -

No. 76 Humpback ♂ June 4-08 Sechart Bl.
Color Back sides top of head black - whitish on
 breast & throat as flashes heard in median
 line - large white spots below pectorals - only
 a few faint white flecks back of pectorals -
 on the left ramus there are a few white circles
 near center up to lips, not many near top or
 corner of mouth - On sides of throat few white
 circles - don't all streaks & flashes in median
 line of throat & breast - quite heavy - chin
 prominent - five pairs white circles behind &
 near eye - On the right ramus the circles
 are thick for about half and half - they run
 down on to sides of throat & breast in median
 line these give place to streaks & flashes -
 The stub of the flukes is black above - below
 it is black with a few white circles - white
 spots on the ant. edge - Inner skin gray-blue

Pectorals Left alone, black strongly circled with white near posterior edge - also on the very ant. edge are white circles - Right - alone is just like left - below is a black patch at insertion which does not touch either edge - rest of fin white with only a few black streaks & only one large circle near anterior margin - a cluster black at tips -

Baleen Bases of all busses steel gray - The bases of the ant. $\frac{2}{3}$ white to tips - the post. $\frac{1}{3}$ has tips very dark gray - these baleen busses are whitest yet -

External Characters

20 white hairs on top of mandibular symphysis - chin prominent - no hairs on bend of left ramus - only 5 bands of left ramus, mostly near tips - ~~fin~~ tip peduncle is well crenulated - body between arms reaches high - deep transverse crease midway between pectoral and pelvic - deep longitudinal crease from penis to navel - 4 or 5 of dark spots on top of the head near spine hairs - dorsal fin falcate + narrow -

On either side from the eye to the middle of the back about 18 scales behind the black spot there is a shallow depression - also on the back just over

the superior edge of the scapula, there is a long low rounded ridge which runs from three feet behind the posterior insertion of the pectoral forward till it meets the transverse depression from eye to middle of back. This low ridge marks the top of the scapula & consequently the top of the back is not round as one might suppose, but flattened somewhat between the shoulders -

One furrow runs up over the base of the pectoral from corner of mouth another runs in ant edge of fin + then slants - a crease comes round from behind & nearly meets it -

Length of jawbone curved = 340
 " " " straight = 300

Fins -

Length right side (straight) = 143

Breadth at top " = 47

" " bottom = 60

" both lobes at bottom = 115

Color yellowish white -

There are 302 plates in the balance one of them whole - the 1st 40 are all more or less whitish chiefly on the inner side. Besides these 40, there are 88 other plates all in the anterior one half of the row which are streaked to a greater

or less extent! Most of these 88 plates are white, ^{or streaked} only at the very base + for but a slight extent; however there are some 15 or so which are streaked with bands of white for $\frac{1}{3}$ of the whole length of the plate - In this row of baleen there seemed to be no uniformity about the position of the streaked plates aside from the fact that they were all in the anterior one half - A plate which was heavily streaked might be followed by one without any noticeable marking, but in most cases the streaked plates were pretty well bunched - All the streaks were on the inner (bristle bearing) side of the plate. In this place the bristles were very white indeed - whiter than any other I have examined.

On a whale previously examined (Baleen No 13) out of 321 plates, 24 were streaked with white in varying degrees, but usually very little + always on the inner side + close to the bases of the plates. All the streaked plates were in the anterior one half of the row -

No 17 ♂ Humpback June 5-08 Gedhart BC,
Color Back, sides & top head & ~~belly~~ black - belly & ~~belly~~

back of pectorals has only a few fine white flecks
 along the edges of the folds & in the bottoms of
 the furrows - the white of the throat is mostly
 confined to the median line & in streaks
 in scales or white on left & same excepting
 at very tip - Right ramus has a few scattered
 white circles (faint) on its whole length -

Part of the mouth has, the median, line white
~~black~~ paler with light purple - on the sides
 the two rolls ~~are~~ are all purple - base is
 slate-blue like tongue & left ramus ^{inside} right ramus
 mostly light blue - There is a small
 white spot on the maxilla - pepper & salt about
 penis & testes - rest of penile black - Stalk
 of claspers black below streaked & circled with
 white - large flesh colored spot in center
 of base of pair in insertion of pectorals -
 White streaks & flashes in median
 line of breast back to white spot

Pectorals Right is black above with scattered
 large white spots on the $\frac{2}{3}$ nearest the tip along
 posterior border tip mostly on edge white & black
Below right fin has a large black patch
 from body halfway toward tip - patch does
 not touch either edge - rest of fin white except
 a few black marks at tips -

Left fin is like right above & below

Baloon Bristles dark gray at base - the tips
 of the posterior $\frac{2}{3}$ also are same color -

tips of ant. & very light gray as is ^{all} the remaining portion of the bristles

External Characters - mouth of flukes is peculiar - shaped like this

22 white hairs on mandibular symphysis peduncle well crenulated - 5 points are right side, top of head bear white hairs - 9 white hairs on very tip of rostrum, 4 on bunches and 5 not - 7 knobs on top of head have long white hairs & also two small knobs beside blowholes on the right side - Blubber is thinner than the belly & thickest on the edge of the peduncle above; just back of blowhole it is thick & also at dorsal fin - The bump on the lower surface of the peduncle is large - a deep transverse crease is before & behind arms.

No 18 Humpback ♂ June 5-08 Sechart BC

Color Back, top of head, sides & belly black -
On the median line of the breast between
& a little behind the pectorals is a
great mass of white - in the area
where this white spot covers the bottoms
of the furrows are pink - anteriorly
this white mass begins in the middle
of the throat - On the sides of the breast are
small white dashes - no white on
throat except a few small flecks -
throat is practically all black - some
white on chin & snout - no white on
left ramus except at very tip & then
only a few circles - Almost no white
on right side of throat & breast - only a few
few small white edgings to the folds - right
ramus has a few large scattering white
circles all on the anterior one half - none on the
posterior $\frac{1}{2}$ - Stomach full of flesh below black
at body with large white patches - no white
from navel to penis - Roof of mouth
light purple & base light slate blue like
the inside of right ramus - Tongue
darker slate-blue - left ramus almost
white inside -

Pectorals Left above has on the half of
fin nearest body a large black patch
which does not touch either edge - rest
of fin is all white with narrow black
 streaks thinly scattered over it -

the posterior edge is black - ant, black & white -
 Under side of flukes all white - only a few scattered
 black streaks at insertion & at edge of very tips -
Baloon Bristles all very white except the
 extreme bases of the ~~posterior plates~~ plates
 which are dark gray - all the rest of the bristles
 are white including the tips of the posterior

1/2

External Characters - Each whale has on
 the under side of tips of rostrum just in front
 of beginning of throat two creases like this -

These creases are well marked in some
 whales & in others not so much so -

Blubber thickest on top edge of peduncle, &
 back of blowhole & at dorsal fin - from
 blowhole to dorsal the blubber thins up
 a little - on sides of peduncle blubber
 is thin - The rudimentary testis or tunica
 is 2 cent long and situated at the root of
 the penis - About 35 rather long white
 hairs on the symphysis of mandible -
 there are 12 knobs on right ramus all of
 which bear ~~each~~ a single hair in
 their center - Dorsal is ^{only} slightly falcate

Top of peduncle is very lightly cren-
 ulated - 6 knobs from blowhole to tip in
 center of break all bearing short hair - 2 white
 hairs on the two knobs beside blowhole on right
 side - 9 knobs top of ^{right side} head ~~not~~ counting center
 line from blowhole - The posterior insertion of the

No. 19 ♂ June 5-'08 Humpback Sechart, B.C.
Color Top of head, back & sides black - mud white
 in small flashes, circular dashes all over throat
 & in median line of breast to pectorals - right
 ramus of maxilla & thickly covered with small
 white circles from tip to begin of down curve
 of mouth - white spot between pectorals in
 median line - in all places where skin
 is thick the bottoms of the furrows are
 pink - all folds of belly edged with
 white - perfectly salt from penis to flukes -
 a few faint white flecks back of pectoral for
 a short distance - Left ramus well marked
 with heavy white circles from corner of mouth
 to tip - a very few faint white circles in tip
 of head from blowhole back to pectoral
 below of flukes black above & below with
 white on anterior margin - Median line roof of
 mouth whitish - sides of roof ^{light} purple - base light
 slate blue as is tongue - & inside right ramus
 is dark slate blue - left is whitish or very light
 slate blue -
Pectorals Left below has black patch at body & rest
 of fin black & white circled - above left fin is black

heavily circled with white all over in irregular patches - Both fins seem -

Baleen Borders of ant. $\frac{1}{3}$ are all white including bases - post $\frac{2}{3}$ dark gray at base + all the rest of borders light gray including tips - External characters - Dorsal from nose to penis - this seems to be fairly constant in all the whales - chin very prominent - 23 short white hairs on top of symphysis - none on right side, tops of head - back above eyes much scarred by barnacles top peduncle heavily crenulated dorsal fin like this  - no hair on left side top of head - Fine fold 6 cent wide runs up on left ramus - 2 creases along left pectoral - both pectorals were very heavily studded with barnacles - on superior surface - Blubber on top of gl peduncle is 25 cent thick -

2020 Humpback ♂ June 5- '08 Sechart B.C.
Cyan Back, sides, top of head black - much
 white on center of throat but not in bottom
 of gills which are black - white is
 only on fold - between pectorals is
 a large blotch of white & a white spot -
 Many white circles on right ramus
 which extend in center up to the edge
 of the lips - a large patch - from
 eye to pectoral, right side, has white edging
 to folds - a white spot on right side
 tip of rostrum below - Only white on belly
 she streaks in very bottoms of all folds
 where they end - penis too lukes pepper
 & salt - No white on sides of throat & breast
 except white - edging to folds & 3 tubs of penis
 base ant. margin white both sides - Dorsal
 surface black - white spots on navel -
 dorsal fin is heavily marked with
 white along ant. edge & on sides -

Pectoral - Right below at post. insertion
 has a large black patch for $\frac{1}{3}$ length
 of fin - rest white marked with wide
 black patches on the $\frac{1}{3}$ toward tip -
 center $\frac{1}{3}$ pure shining white - with edges
 black - Left fin same as right

External Characters Top peduncle well
 crenulated - bunch between arms & flukes
 is low - penis bulge high - notch of flukes deep
 + closed tight - edge crenulated -

+

dorsal fin thin - 28 white hairs on symphysis
 11 hairs on tip of rostrum all on bundles - on
 top of head 5.5 cent. back of end of bluish stripe is
 a thick bunch of short yellowish hair, very stiff
 between bluish stripes at posterior end is another
 smaller bunch - The larger bunch is also
 a little larger than a dollar - Seven
 low bundles on right ramus with hair on four
 of them

The pelvic bone of this whale measures as follows

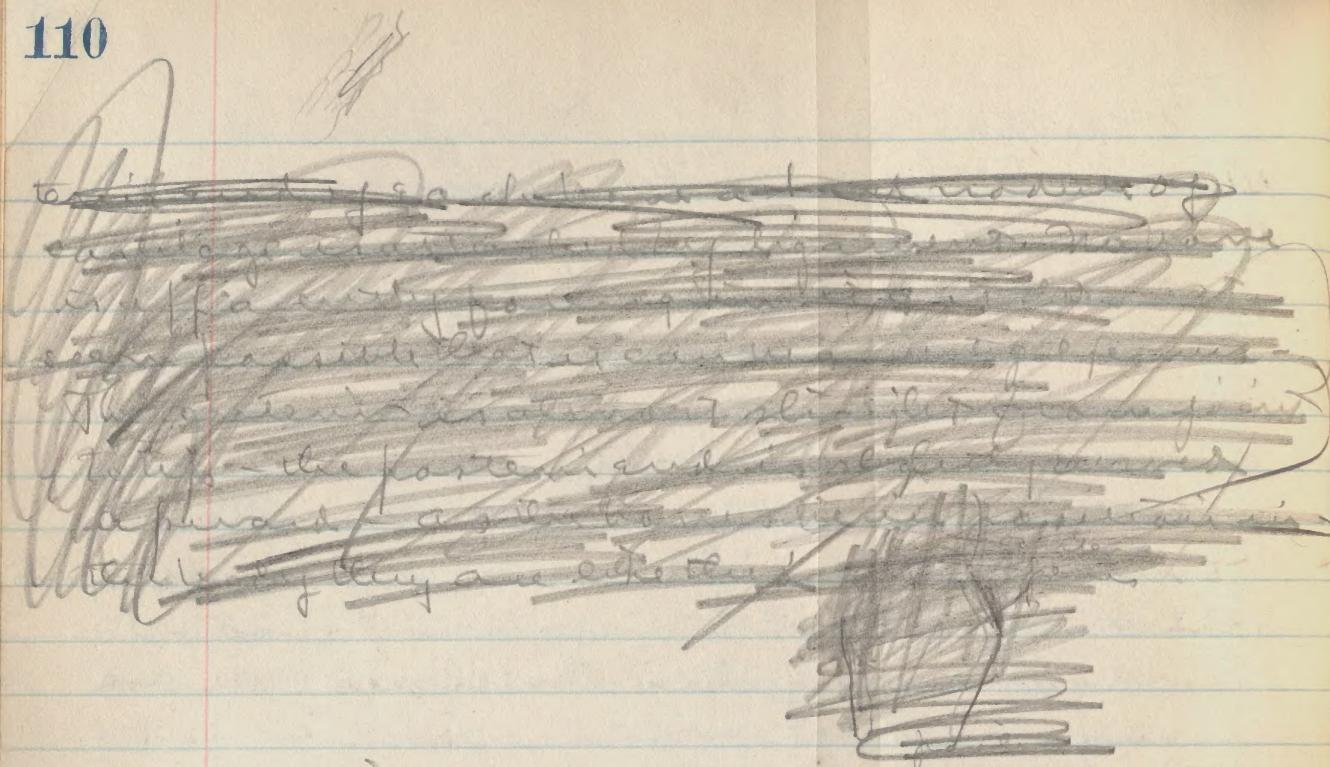

Left (straight) = 235 mil.

" (curved) = 255 "

Right (straight) = 250 "

" (curved) = 260 "

A hard prolongation of cartilage is on the
 end of each bone, (50 mil. long) this cartilage
 looks much like bone & can only be dis-
 tinguished from it when the bone is
 covered by a little fat, by cutting. The pro-
 longation at the anterior end of the left
 bone is 50 mil. long. The anterior end of the
 bone is shortest & thickest, it is attached by
 cartilage & ligament to the root of the penis.
 At the joint or curve of the bone, where a recti-
 gal finner would be attached, no sign
 of it was to be found and as I cut the flesh
 away most carefully, it could not
 possibly have been missed. ~~No~~ - of

With considerable difficulty I stripped the skin from the right flippers and cut away the surrounding matter, exposing the various elements of the pectoral. The formulae for the phalanges is as follows (see plate) I 2 II 8 III 7 IV 3 } 20 metacarpals 4 etc (that is the 1st digit the one nearest the anterior edge of the flipper which would correspond to the human thumb - as the blubber etc, was all cut away with a small knife there is not the slightest chance that any phalanges were missed).

The distances that the metacarpals are separated from the 1st phalanges of the respective digits, are as follows -

$$I = 80 \text{ mil}$$

$$II = 90$$

III 94 almost all the phalanges except
 IV 9d the very anterior ones near the
 tips are about 90 mil. apart.
 The first large bump (largest) on the ant.
 edge of the foot is caused by the distal
 end of the radius - the 2nd & 3rd low
 rounded mounds are at the distal ends
 of the 1st metacarpal & 1st phalanx of
 the 1st digit - The fourth (which is the
 next largest bump to the 1st) is formed
 by the end of the 2nd phalanx of the 1st
 digit - the other mounds are caused
 by the 2nd, 3rd, 4th & 5th phalanges of the
 2nd digit.

The radius is 170 mil. long (at right in
 median line) The ulna is 565 mil
 width radius at distal end = 260 "

" " proximally = 160 "

" " ulna distally = 170 "

" " proximally (including olecran-
 on is) 140 mil.

With R + ulna in position proximally
 = 330 with R + ul distally = 440

The carpus has no ossifications what-
 so-ever, no any indication of a special
 hardening of the carpalos & comparing
 the carpus

no 21 ♂ Humpback Sechart Bl. June 13 - 08

Color Back, sides, top of head, black - throat has scattered large white circles, which lie mostly in the median line + toward snout - sides of throat + breast has no circles - white spot between pectorals - white flick-like edging to the folds back of eye + about five furrows on belly have a few white flicks on edges - there is almost no white on left ramus - penis to flukes pepper + salt - white in bottoms of furrows from penis to snout - skin of flukes black below with few white flicks + circles - white spot underneath the tip of rostrum - roof of mouth palited light purple + violet - base slate blue as is tongue - underside both rami are very light slate blue, in some places, almost white - Right ramus (outside) circled with scattering white circles from tip to mouth -

Pectorals Left fin black above with white circles along posterior edge on the tip $\frac{1}{2}$ - Below fin is black at insertion + tip - center third is marked + spotted black + white

Baleen Bristles of extreme bases of all plates dark gray - of tips of posterior $\frac{1}{2}$ seal brown center of post. $\frac{1}{2}$ + all of ant. $\frac{1}{2}$ light gray -

External Characters

Top peduncle well crenulated - notch of flukes open + deep - 22 cent deep - edge strongly crenulated - 2 to white hairs on the top of synaphysis - outside two hairs

on left ramus - 5 on 6 hairs on the branches of the
anterior at symphysis. The opening of the rudimentary
teeth is 15 cent - teeth lie ~~only~~ side by side in line, touching
each other, & are 4 cent. long. - dorsal fin low & straight
with a sharp tip

No 22 ♀ Humpback June 13 Sechart B.C.

Skeleton taken fetus 18 inches long

Color Back tip of head sides + belly black - no white whatever back of pectorals to navel - large transverse white spot between pectorals - bottoms of fins blue are pink - a small white spot near anal ventral navel - white on breast is mostly in small patches + feathers - ant. edge dorsal has a white patch ^{posterior white} - white circles on right ramus on ant. $\frac{1}{3}$ - none on post $\frac{2}{3}$ stub of flukes has ant. edge white - no white circles or sides of breast, but a few on throat right side No white circles on left ramus whatever a few scattering ones on left side of throat - none on breast from beginning of curve of mouth back - Roof of mouth has base light blue - slate as is tongue - roof

is light purple with a few small olive green
flecks in the center of anterior portion -
elsewhere right rostrum is slate - left rostrum
brown / lighter -

Baleen - Bristles of dorsal whale are dark in
general effect - bases all dark gray -
and 1/3 to tips light gray - part $\frac{2}{3}$ has a narrow
light gray area in center + rest to tip seal
brown -

External characters - #. Total extended is
4 cent long - width of flukes is 22 deep,
like tail. The eye, vertical dia-
meter between $\sqrt{\frac{1}{2}}$ lids, is 1 cent - lids &
thick would be at in life - 22 white hairs
top symphysis - 18 hairs top of head right
side (counting middle line) 12 bear hairs - all
ey mouth line bare hairs - top peduncle
well crenulated - bony ridge chin is 4.5 -
long & high & double - begins 2.5 cent from
tip of symphysis 7 hairs right rostrum
all in front 1/2 - 5 bear hair (chin) 7 hairs right rostrum
each side symphysis tip of rostrum to
beginning of baleen 11 11 hairs ey & sides
top of head not counting center line -
3 filaments run up on fin half way,
from posterior side - blubber on sides in
thick at tops of pectorals last back -

Osteology

There are 11 lumbar 5 unless the lumbar sacrum

Dorsal fin lobes white on both edges

117

which is only present on the right
the supplementary last rib be not counted as
a lumbar - Then formula would be as follows

C₇ D₁₀ L₈ S₁₀ Ca

or C₇ D₁₄ L₁₁ Ca₂

There are 10 chevrons - the 1st is small & has
no basal spine, 2nd largest & joined at
several ends - 3rd is highest of series with
longest spine - 4th is about same height
as no 2 & they all decrease rapidly in
size to last - I have noticed this same
arrangement in all the Humpbacks
so it may be considered constant

1 2 3 4 5 6 7 8 9 10 chevrons

Length of articulated skeleton is 41 feet 5 inches.
Rudimentary last rib on right side only -

Ribbs = Right 15 - Left 14

The terminal caudal is no bigger than a
large pea but is fully ossified -

There were only 3 ossifications in the
carpus - all five in proximal row
~~none~~ none had reached the surface

No 23 Humpback ♀ June 18-18 Sechart B.C.

Color Left side of body thinly flecked with white from pectoral to flukes - flecks are ~~most~~ thickest just back of pectoral & on sides of peduncle from vulva to flukes - from navel to flukes peduncle & belly are heavily marked with white in flecks - belly all white flecks heavier along edges of folds - breast & throat heavily marked with white, which runs on sides up to insertion of pectorals - white is very heavy in median line - both edges of dorsal are strongly white - white circles on both rami from corner of mouth to tip - ^{heavier on right ramus} Pectorals Left alone, black heavily circled with thick white circles along posterior margin & on the $\frac{1}{3}$ of fin toward tip. - These circles look "washed out" Underside, right, white with black circles at $\frac{1}{3}$ toward tip - these circles look "washed out" - Both fins same - Baleen - Bristles ~~base~~ at bases are dark gray - ~~&~~ all rest of bristles to tips lighter gray - Roof of mouth purple with small olive green

fecks in center - base olive green - inside
right ramus dark slate

External Characters 5 creases run on
posterior edge of fin at regular nearly accy
to ant. edge. 30 white hairs on symphysis
11 furrows on left ramus none of which bear
hair - 18 barbs (with center line) left side top of
head no hair on them - top peduncle strongly
excavated -

no 24 Humpback ♀ June 18=08 Sechart B.C.
Color Back, sides top of head black - in center of
 throat & breast form a little back of snout
 to pectorals is a great white blotch - This blotch
 extends up on sides to within 18 inches
 from being on a line with insertion of
 fins - in some places the white is solid
 with no black streaks, but it is mostly
 streaked with narrow black dashes
 about 6 inches long - At very centers
 of throat & breast, a narrow broken
 band of black runs thru' the white nearly
 to pectorals - The bottoms of the furrows
 in this white patch are pink - also when
 they end on belly from one to two feet
 bottoms of furrows are pink - almost
 all the furrows have more or less
 white in their bottoms - just back
 of the very large white patch is another
 smaller one, separated from other
 by the black of the belly - There is
 little white about the genitalia -
 none from navel to genitalia except in
 bottom of median crease - white spot
 about navel - Many white circles
 on right ramus about tip, ~~top~~ & on chin
 little of pinkish black below - ~~and~~ margins
 white - Roof of mouth very light purple
 base light slate - inside right ramus
 very dark slate & ~~soft~~ very light -

Pectorals Left, below, has base at insertion black - rest white barred & spotted with black - both edges black - Right, above, all black with some ~~small~~ rather faint white circles in $\frac{1}{3}$ towards tip along part. margin

Baleens - Bristles of all bases steel gray - in flat part. $\frac{1}{2}$ of the row this steel gray goes half way up & rest is dark gray - the ant. $\frac{1}{2}$ has bristles with white band in center tips dark gray -

External Characters Top peduncle well crenulated - dorsal fin has hook at tip - tip seems to have been injured -

2 hairs just back of blowhole not on bunchy 14 bunches top of head bear hair, 7 of which are on those at tip of rostrum - 37 thick white hairs on top of symphysis - only four besides on right ramus except at symphysis - chin very prominent notch of flukes 17 cent. deep & open like this - Blubber on top of peduncle 39 thick

Osteology

11 Limbars present (seen)

Arrangement of chevrons same as in all others - 3rd being highest of series -

14 pairs of ribs (seen)

Skull

Length (straight) = 400

Breadth (squamusal) = 235

jaw

straight
curved

380-

425-

The sternum does not articulate with the distal end of the first rib, but some distance up the rib on the inside edge. In this whale I removed the rib & attached sternum & carefully cut away the adhering flesh & sinew, (see photo) consequently being able to take measurements, etc. with accuracy. The sternum articulates with the first rib on the inside edge, 230 mil. from the distal end of the rib. The space between the ⁱⁿ side edge of the rib & the arm of the sternum, which is filled with cartilage like that between the phalanges on the pectoral, is 59 mil. The ligaments & cartilage surrounding allow of little movement up & down, but considerable back & forth, or outward & inward - The bottom joint of the sternum is 183 mil. from the distal end of rib (inside edge) The center of the rounded top edge of sternum is 370 mil from inside edge of rib - The distal ends of the two ribs, articulated to the sternum, would, by estimate, stand 180 mil. apart (inside edges)

Length of sternum (cleaned) 415 mils

Breadth " "	400 "
-------------	-------

Length bottom joint	68 "
---------------------	------

" top "	190 "
---------	-------

Breadth arm (distal)	110
----------------------	-----

Rib

Length straight = 1290 mil.

" curved = 1430 "

Breadth distally = 140 "

Greatest breadth = 175 "

Breadth proximal end = 110

This sternum is strongly concave on its outer side & less strongly convex " "
never ". Both arms are strongly curved inward -

Seafaria (cleaned) (see photo of no 23 & 24
Greatest breadth = 1400 mil. ~~superficial~~)

" height = 960 "

Length glenoid formula = 370 "

A careful comparison of this sternum with that of no 23 failed to show me any marked differences - in fact the only difference I could detect was in the super-scapular border which in no 24 has at points such a regular bimacular curve as in no 23 - (see photo for more detailed comparison). The attachment of the sternum to the ribs is constant and I found it in a number of others -

On June 22nd left Sechart on the steamer "Teed" for Kyegnot B.C. reaching the station there on the morning of June 24th. When I arrived four Humpbacks were on the slip, and at 5:30 the same afternoon the whaling steamer "St. Lawrence" returned towing a Sealphumbottom. Mr. Puck, manager of the station, kindly had the whale pulled out on the slip, + left until the next morning, thus giving me an exceptional opportunity for close study on the specimen.

No. 25 ♂ Sealphumbottomi June 24-08 Kyegnot B.C.

Color. - Top of head, back half way to pectoral inser^{tion}, or about opposite ear, is dark bluish-gray - throat, chin + lips, of same color - no spots on top of head - back + sides from ear to flukes is a blue-gray much lighter than the color on head - from eye to ear is a rather narrow band of fine, irregular specks + spots of ash color - larger spots with irregular edges + of all shapes + sizes (but for the most part 2 or 3 inches long) cover the upper half of the sides + back to flukes. The ^{elaps} ~~spots~~ are small + very thick from eye to pectoral + above it, making an almost solid area of ash. The ~~st~~ markings sweep up over the base of the pectoral, then ^{obliquely} along a ^{sharp} turn, downward beyond posterior

insertion of the fins, along the posterior edges
 of the pectorals, ~~but the axillary~~
 & to the very median line of the sides - they then
 turn backward, the long axes being horizontal
 & run to the flukes. The markings on the
 sides of the peduncle are larger & more
 scattered than those nearer the head -
 there in the very top line ~~on~~ peduncle have
 their long axes turned slightly upward
 from dorsal fin to flukes, the top edge
 of the peduncle & about a part down on
 either side has no markings - the markings
 extend on top of back from head to dorsal
 fin. As I have said, the throat chin & lips
 back to pectorals are dark blue-gray like head -
 From pectorals to navel, the breast is a little
 lighter shade of blue-gray, shading into the still
 lighter gray from navel to flukes - a line
 of white flecks & spots run from lower
 inst. of pectorals on left side diagonally
 down to median line of breast - on
 breast between pectorals are scattering
 darkish or dove colored blotches - a
 small mass of these dove colored markings
 on side of throat (left side) just below
 corner of mouth - thick lot of markings
 from corner of mouth to inst. of pectoral
 & just below it - no other blotches on
 throat or breast - No spots on
 median line from navel to
 flukes, but on sides of peduncle ~~of~~

markings run down nearly to median line
 Dorsal fin is very light gray along its anterior margin - rest of dorsal same color as peduncle -
 Inside both rami of mandible has and.
 $\frac{1}{2}$ white - part $\frac{1}{2}$ very light gray - Roof of mouth indigo - Sides of flukes dark slate
~~gray~~ blue or gray like head, above - below & very light gray blue with fine darker wavy lines running antero-posteriorly curving upward & not quite reaching the posterior edge.

Pectorals Left above dark gray except at tip, where it & the ant. & post. margins from far one foot back ward are cream white - under side all cream white to insertion - The right fin like left above & below except that the white anterior margin extends half way to insertion. Both fins have had the tips injured; they look as tho' they had been chewed off - Mr. Buck says many are in the same condition.

Baleen - Indigo ~~blue~~ both plates & bristles - baleen trunks meet in front by a thin line. Roof of mouth is indigo & is 17 cent. wide & ribs are parallel - half way back the sides begin to ^{widen} curve outward & the median ridge is low & begins half way back - baleen begins 19 cent. from tips of snout.

The epidermis feels off very easily & below the dermis is very light slate blue, which

soon becomes darker on exposure to air.

The white whale has a very distinct bluish cast - it looks as tho it had had a thin wash of blue all over it - I noticed that two hours after the whale had been pulled out on the ship, it was decidedly darker than when first taken from the water.

External Characters There are 24 white hairs on resupphyis / cent long - these hairs run in ten ~~five~~ vertical lines 8 cent apart from top of resupphyis down - 13 hairs on top of head scattering - 3 are on side opposite the blowhole - others are on the side of top of head half way from blow-hole to snout -

Eye The eye is situated 23 cent. above corner of mouth, ^{tailweb} 7 cent above eye there is a deep furrow or crease 26 cent long & curved - between eyes & this long crease are 3 other shorter creases from 12 to 5 cent long. 5 cent below eye is a long crease 26 cent long converging to one above turned - the ends of these long creases stand 11 cent apart anterally & get posteriorly the creases run in a \wedge shape from front of eye forward 14 cent.

Ear It's 4 cent wide & elliptical in shape its long axis points diagonally toward post. inser. of fin -

Four long creases run out of corner of mouth nearly to insertion of pectoral - two other shorter ones run parallel above these, but they do not come from mouth or reach fin.

Dorsal Fin is low & triangular - the posterior border has ~~somed~~ some slight concavity - the extreme tip has been injured  The top of the peduncle from dorsal fin to pectoral is thin & rounded.

~~Flebes~~ - Top edge of peduncle is 56 cent from the center of the anterior margin of the flebes - bottom edge is 46 cent. ~~46~~

~~Flebes~~ are placed at a slight incline upward - notch of flebes 19 deep - edges of notch overlap - On the flebes below the edge of the peduncle disappears 28 from notch - above 31 from notch -

Folds - are widest near navel where they end - here width is 12 - Point of greatest depression of folds is between pectorals - They are narrowest on throat. Folds are wide where they run upon ramus, are broad & between pectorals they are very narrow (4 was average width on throat) and as they go backward widen out gradually, so that those of belly are much wider than on throat & fore-breast - The

furrows are 2 deep - bottoms are same color as top of folds, & the skin looks like coarse coffee paper -

Peduncle From dorsal fin back for 200 cent. the top & bottom edges are almost parallel - then, at and anterior to the edges slope abruptly to the fleshes till they are lost on the lateral expansion of the tail - the top 31 cent from the notch & the bottom 25 from notch - The bottom edge, where it begins to slope up to the fleshes is more gradual & straighter than the top edge - Fleshes are placed with outer edge a little closer to bottom edge of peduncle than top - i.e. at a little angle to the plane of the body -

On the underside tip of rostrum are the same sort of depressions or marks as observed in the skin blocks, only a little larger

(1) Below begins 19 cent from tip of snout the balerum row is 27 cent. from the edge of snout on the sides.

Six creases run from underneath feelings upward ~~the~~ superficial surface half way to ant. edge. Posterior edge of fin is very thin as its post. edge of fleshes - Dorsal edge of peduncle is thick nearly as thin as upper -

Penis has 4 creases of varying lengths on either side of the median line - creases vary from 30 to 50 cent. & a crease of varying

depth runs from navel to penis - Penis (exten-
ded) is light brown at base & for $\frac{1}{2}$ its length
distal $\frac{1}{2}$ is slate-blue.

The eminence in front of & on sides of
blowholes is 177 cent. in ant.-post. diameter.

Osteology

skull Length (straight) = 525 cent.

Breadth (squaremeal) = 260 "

jaw Length (curved) = 540 cent.

straight = 490 "

Ribs 15 left side

16 right side - the 16th rib is short & very
^{& almost straight} slender - it is 46 cent long & is, of course,
rudimentary.

Vertebrae C₇ D₁₃. L₁₅. Ca₂₇ = 64
or

C₇ D₁₆ L₁₄ Ca₂₇ = 64

Fourteen lumbar were present, but if
the ~~15th~~ vertebra bearing the 16th rudimen-
tary rib is counted as a lumbar &
not as a dorsal 15 will be present.

There are 27 caudals the terminal being
about the size of a pea or hazel nut, it
was composed of dense white cancellous
tissue & would have been lost had
I not been watching for it. These
caudals were put in a tank & boiled
separately so the ~~-~~ formula is
positively correct.

The bottom of the 1st caudal was clean-
scaled, there being two prominent knobs

These bones were 89 mm apart (inside edges)

on the posterior end for the articulation of the 1st chevron. These bones (see plots) were so far apart that the inferior median carina must have begun ~~to be~~ ^{to be} divided on the next to the last lumbar.

Measurements of 1st Carpal (cleaned)

Tip of spine to lower edge centrum	95.0	mil	(posterior)
Greater breadth (bet. trans. processes)	91.0	"	"
Depth of centrum.	35.0	"	"
Breadth "	39.0	"	(anterior)
Height of spine	47.0	"	(anterior)

Chevrons There are 16 chevrons present & between the 17th & 18th caudal, on the left side are half of another small chevron - so that 17 might be counted. This half chevron was 6 mil long & 3 mil wide, concave externally & convex internally, & had the regulation shape & form of a chevron, & it was embedded in the ligament & at first one would have said there was nothing there, but I cut it out very carefully so that I could not possibly have missed the other half if it had been present - The 16th chevron (the last complete one) is composed of two laminae irregular & circular in shape, which are not joined distally except by cartilage. The right one is 108 mil. in greatest breadth length & 95 mil. greatest breadth. This chevron is densely between

the 16th + 17th caudals + articulates to both by ligaments. The remainder of the chevrons so far as I could see were joined by ~~lig.~~
at the bottoms. The 1st. chevron is small, + free distally, the ends standing about 20 or 30 mil. apart. The 2nd chevron is found distally + is considerably larger than the 1st - 3rd is much larger than 2nd + 4th the largest of the series; back of fourth they descend gradually in height to last chevron. In position may be represented like this

Scapula The scapula has a large acromion & well developed coracoid process. The acromion is very long + strongly curved ~~inward~~, ~~so that~~ it projects downward. It is wider distally than proximally - distal end is rounded.

The coracoid process projects downward + is parallel to the acromion - it is rounded distally -

The scapula is concave externally but only slightly convex internally - The interior surface has 7 low ridges or veins some radiating outward from a little above the glenoid fossa - they reach the super-scapular border. The postero-lateral fossa is well marked. The suprascapular

border is 40 mil. thick at ant. end, thinning down to 10 mil. in the center & thickening again to 50 mil. at posterior end. This border is flattened in the central portion & does not have the rounded border characteristic of the Atlantic's *Sulphuratherium*; it resembles it in back more closely in this respect.

Measurements of Scapula (cleaned) see photo

greatest height (q. fissa to sup. deep edge center)	840 mil
" breadth	1390 "

" glenoid fossa	300 "
<i>Tengm. acromian (median)</i>	360 "
" " (lower edge)	330 "
Breadth " distally	180 "
" " proximally	160 "
<i>Tengm. coracoid (median)</i>	140 "
" " (lower edge)	90 "
Breadth " distally	70 "

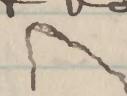

Cervicals

Atlas Neural arch rises in a thick triangular crest having a blunt spine 30 mil. high on the summit. The transverse process rises from the upper half of the body; it is thick & is directed upward & backward over the base of neural arch on either side. It bears a horizontal foramen 35 mil in diameter, etc. to the neural canal.

greatest breadth	750 mil
" height	440 "

Breadth articular sur. for occ. condyles	390 "
greatest transverse process	180 "
Breadth " " distally	160 "

Breadth of open space between articular surfaces for acc.
condyles at top is 100 mil. - at bottom 40 mil.

Ax's. Upper & lower transverse processes are joined distally on both sides forming a large wing like process ^{enclosing} ~~with~~ a wide and opening which is 220 mil. long diameter,
occupies a little more than the proximal one-half of the process. The laminae ^{of the neural arch} are heavy & meet to form a massive triangular crest having a blunt ground tip. This crest has ^{irregularly} perpendicular anterior wall,
but posteriorly the surface slopes from the tip downward & backward forming an angle like this  This surface is deeply concave in the median line.
Two foramina, one a little above the other, perforate the neural crest in the ant. post. direction connecting with the groove in the posterior surface.
The parapophyses is wide & heavy, flattened inferiorly & much thicker & heavier than the epiphyses - The two project strongly backward & somewhat downward -

Ax's Measurements

Greater breadth	= 1130 mil.
" height	= 530 ..
Height of body	= 280 "
Breadth "	= 450 "
Length of transverse processes	= 420 "
Breadth distally	= 300 "

Third Cervical - Has the dia- + parafphyseal clefts distally by a rather narrow margin enclosing a wide and opening 26 mm in long diameter. Both processes are much more slender than those of the axis & the margin distally is much narrower; the diafphyse is more slender than the parafphyse. The two project backward & somewhat downward. The laminae of the arch are wide & flat, directed strongly backward, & united mesially in a blunt spine 30 mm high.

Fourth Cervical - has the 2 processes united distally like 3rd, but by a narrower margin. The diafphyse projects downward, & only slightly backward. The laminae of the arch are not united mesially, there being a space of 15 mm. between their inner edges.

The parafphyse projects backward & downward.
Fifth Cervical - The two processes are not united distally having a space of 40 mm between their ends. The diafphyse projects downward & very slightly backward; the laminae of the arch meet mesially in a low blunt ridge.

Sixth Cervical - The upper process is long slender, & projects downward & strongly forward. The lower is very short wide & flat, projecting downward & strongly ~~forward~~ backward. The laminae are united to form a low sharp ridge.
These while 7 Cervicals were free

No 26 ♂ Humpback Kyuquot B.C. June 27-08
 I did not take detailed measurements of this whale - one lobe of the flukes, the left, had been left over

Total length 1368

Length left lobe flukes axially = 245

Greatest breadth (and post.) ^{below} = 112

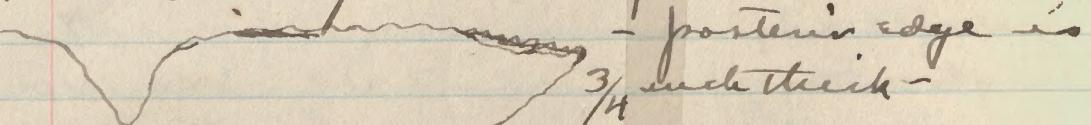

Left lobe of flukes has bare at insertion black - rest of flukes shiny white except a narrow black edging on posterior margin + some ^{black} anterior. The other lobe is

like the left, so far as it is preserved -

Bare fluke is black with a small irregular white patch in center ^{at} posterior edge. The posterior edge is scalloped with short deep emarginations - these

crenulations are longest & shallowest near proximal base of fluke; distally

has the scallops short + tips sharp - notch is deep & V shaped like this

$\frac{3}{4}$ inch thick -

Bristles of baleen have extreme

variations dark gray - rest of
 bristles of ant. ½ pure white to tips.

post. $\frac{1}{2}$ has tips dark gray & rest white -
 all the plates of the ant. $\frac{1}{2}$ are streaked
 with broad bands of white, which in the
 very ant. ones show from outside -
 This baleen looks almost like Finback, it
 is so white -

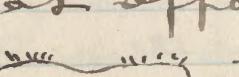

No 27 Humpback ♀ June 27-08 Kyuquot B.C.
Color Top of head, back, sides to dorsal black
 from dorsal fin to flukes sides are flecked
 with white - Large white circles on left ramus
 + white marks - Much white on throat +
 breast to a little back of pectorals heavier in
 median line - belly + sides, ^{of breast} to tips of maxilla
 flecked with white - Under side from maxilla
 to anus heavily marked with white in
 patches + spots - Stalk of flukes below
 heavily circled with white. Bottoms of
 flukes are white where white is heaviest
 over ~~the~~ pink

Left Pectoral above ^{black} white heavily circled
 with white along the posterior edge of the
 distal portion - Ant. edge black + white
 Right fin below white marked with black
 streaks + spots mostly in distal one half -
 black patch at insertion -
 Dorsal fin falcate, with white on both
 edges -

Baleen - bristles at base are dark gray
 rest of ant. half white to tips - Posterior

half are gray at tips - between tips & base
bundles are soiled white -

Tongue light blue ~~like slate~~

External characters Eye is 20 behind
corner of mouth & 23 above - the dorsal
fin is falcate & situated on a prom-
inent hump. which is 95 mm above
post. diameter - 20 white hairs on
syngnathes, arranged in two patches
in areas opposite each other, like
this  - there is a slight depression
between them 17 pustules on the left
side top of head (counting median line)
12 of which bear hair - top falcate
is well circumscribed

This whale contained a ♂ foetus No 27a
There is a deep groove between the blow-
holes which runs up on top of the
emergence in front of orifice -

No 27a ♂ Humpback Foetus Mother No 27 June 29

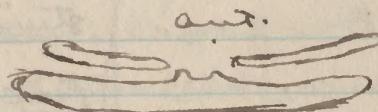

Eye is situated 13 mil behind & 23 mil above
corner of mouth - it is on a rounded swell-
ing - 2 well marked creases above & below -
On top of head were 27 small knobs - those
of the median line (composed of 5) were largest.
None of the sides could be easily felt but hardly
seen on dorsal half of rostrum -

Rostrum is in a V shape having the sides
slightly bowed outward & the tip blunt &
rounded - 20 mil behind posterior end of
blowholes the sides of the rostrum
abruptly widen out to form the
swelling which contains the eye -
The blowholes are a little below the general
level of the summit of the head; in front
of them is a higher triangular bump
rounded on top which slopes away rap-
idly toward the snout forming a low
rounded ridge on the median line of
the rostrum - This ridge bears 5 low
knobs which make a series of shallow
depressions or emarginations for
its entire length - The edges of the
rostrum are thickened, & bears a double
line of alternating knobs - This leaves
a shallow depression between the
median line of the rostrum & the
sides - The top edge of the peduncle
from d. fin to flukes show the crenulations
plainly

Dorsal fin falcate - sharp at tip - keels on
rami of mandible plain - The tongue is
large filling the whole mouth cavity -
its tip is broad slightly crenulated & divided
in median center.

The stylophores are found to the
base of the spine by their ant. ends -
the post. ends lie in front of
basibranch, being a short distance
from the keels on the ant.
~~edge of the basibranch -~~
like this

I carefully dissected this specimen and
found the vertebral formula to be

C₇ D₁₄ S₁₁ Ca 20:52 I am positive that
this is correct - There were 14 pairs of ribs.
There were 10 chevrons - 1st. free distally &
small, 2nd. larger & joint distally &
3rd largest of the series - the last chevron
could be just distinguished but was ~~poorly~~
perfect. I found the pelvic bones well
fused in this specimen - they lie with
the short ends anteriorly & curve around
the root of the penis like this

penis. A short hair was present
on nearly all the dermal
~~soft~~ tubercles on tip of head.

Osteology No 287 (cont.)

The scapula, part of the caudals etc were boiled separately -

The three last caudals were ankylosed, forming a triangular bone which nevertheless showed the suture plainly.

Fist Rib Has no head or neck - neck compressed in its distal $\frac{1}{3}$ - in the proximal $\frac{2}{3}$ a cross-section is an ellipse just above the articular surface for the sternum the inner edge has a thin ~~flat~~ flange curved outward - rib is widest at articulation with sternum

Length straight = 1130 mil. width distally = 190 mil.

" curved = 1150 " articulation = 160

Sternum - has a small shape - length 400 mil. breadth 400 mil.

Fist Cervical - has the paired upper edge for a articulation of top, it becomes very prominent - this vertebra would really be the 2nd caudal but the neural canal is small, it doesn't been prominent - greatest height (post.) = 730 mil Height body = 350

" breadth (") = 710 " breadth = 380

Scapula Greatest breadth = 1330 mil. length of coracoid

greatest height = 900 " (from tip to lower edge) = 360 " (edge glenoid fundus)

Glenoid fundus = 360 mil. Glenoid fundus = 360 mil.

Surface has a marked depression in its center where it is very thin - probably an injury. The supercervical border is convex, the height near the glenoid edge than in center

Atlas has a thick trans. process projecting outward & slightly upward from the upper half of the body - the laminae of the arch meeting a little sharp ridge - the two horns forming down the back of the arch are robust - axis. The axis has a short & parapophyses - the latter is heavier than the former - these do not joint distally - the neural arch is large & massive

The 3rd & 4th cervical's have a dia - parapophysis not meeting distally - the lower processes of the 4th is very short -

The 5th has a dia - parapophysis & on the left side a small knob representing the lower process - this is best preserved on the right side.

The 6th & 7th have only one upper process all the vertebrae are free and have the laminae of the arch ununited above - The 6th & 7th have the highest spine of the series

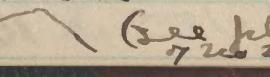

No 28 ♂ Humpback June 27-08 Kyuquot B.C.

Color Back, sides, top of head & belly black - Breast almost lacking white except a few small flecks on median line & 5 large solid white spots on the folds opposite to each other, between the pectorals - A few of the fins near when they end are belly have deep pink bottoms for about 1 foot off rear end. No spots or white at all on left ramus & only a few white spots & scales on left side of throat -

On right ramus are a few small white flecks & faint circles along white length - Penis bulge is enclosed by a white ring on either side - only a white on lower edge of peduncle is in middle

Pectorals Left, above black - streaked with barnacles - below is black at center rest of fin white covered & marked with black on distal half -

Baleen Bristles at base are all gray - rest of ant half white to tips - post $\frac{1}{2}$ has bristles at tips seal brown - rest light gray -

External characters 18 white hairs on top of symphysis 5 creases spread out in a fan shaped arrangement from nose backward - like this
 8 hairs left side tip of head - four 
 knobs on side left ramus near base dorsal fin just like no 26 (see photo) 

both edges dorsal white - it had the form of this whale weighed + the scales registered 767 lbs. The one of the testicles was taken which weighed 20 lbs + measured as follows Length 6.20 in. cir. of large end 5.80 in. & it was shaped like this

Osteology

shell Length = 356

Breadth (apronormal) = 207

Jaw Length straight = 340

" curved = 380

Ribs 14 both sides (seen)

Vertebrae C₇ D₁₄ S₁₂ Ca 22 = 515 (seen)

Cervicals ~~Only~~ Cervicals were present the usual small one ~~at~~ at the beginning of the series being absent - it cut the surrounding flesh away most carefully with the assistance of Mr. Beck, so that it could not have escaped our notice.

The cervicals, thus had the 1st large & joined distally, & the 2nd the largest of the series -

Measurements of whale

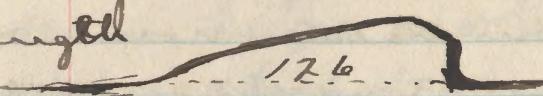

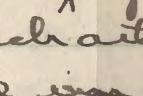

1 = 1390	8 = 62	16 = 405	26 = 23	38 = 320

			34 = 130	

No 29 Humpback ♂ June 29-08 Kyugut B.C.

Color Top of head, back, sides, & belly black - penis large enclosed by white - white in patches from penis to pectorals - nose to fins without white - white spot on navel - No white on sides of throat & breast except in bottoms of the folds - large heavy circles & spots of white on throat in very median line from symphysis there continue to pectorals but not so heavy. The solid white spot between fins is present but rather small & half in bottoms of the flippers - considerable white in bottoms of flippers where they end - no white from pectorals to navel except ~~at~~ in bottoms of folds - ~~top~~ dorsal fin has tip and posterior edge white - There is no white on left ramus - a white patch on either side tip of rostrum below - tongue rather dark slate blue (due I think to being out of water over Sunday) Roof of mouth is pink colored - base light slate blue - Sticks of flukes black above & below - blowholes have white edges & the deep median crease -

Pectorals Both fins alike - all black below except for a long white patch which runs from ant. edge at insertion, ^{longitudinally} along fin for $\frac{2}{3}$ its length

Baleen - bristles have bases of ant. $\frac{1}{2}$ dark gray - post $\frac{1}{2}$ bases light gray - tips of all " " " - median portion throughout white -

External Characters Top of peduncle well crenulated in long waves, heavier near pectorals; tips of dorsal blunt - it is situated on a prominent bump 12.6 in ant.-post. length  a deep cleft from corner of mouth runs up over fin a little beyond posterior edge - another runs to ant. edge + slopes - 21 soiled white hairs on ^{tip of} synapophysis interspersed patches opposite each other  8 tubercles on left ramus all run $\frac{1}{3}$ of fin toward tip - the wide shallow transverse depression on base of top of head from eye to post. end of blowholes is well marked; this meets with the longitudinal depression over scapula - latter begins 15 from snout - 5 tubercles on either side of synapophysis - width of flukes 17 deep -

From now on all measurements will be taken from the tip of the upper jaw.

see page 153 for measurements

No 30 Humpback ♂ June 29 - Kyuquot B.C.

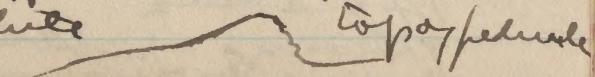

Color - Top of head, back, sides & belly black - no white left ramus of mandible - right ramus has a few large white circles on and one-half. White is in streaks on median line of breast - on throat white is in spots & patches - none on sides - the white spot is between fins, - none back of pectoral fin to flukes except a little grayish or scattered white about pectorals - a small white spot on dorsal

Flukes black above & below except at very tip where there are some white circles on top & ant. edge - tip of flukes foliate & faint. Edge deeply scalloped - many barnacles on alt. edge distal $\frac{1}{3}$ pronounced

Pectorals Black above with few large scattering white circles along posterior edge of distal $\frac{1}{3}$ - below - black patch at insertion - rest white with black marks in center of distal $\frac{1}{3}$ - posterior edge black & tips also.

Roof of mouth pink - bare blue-green - blue-green flecks in center line - tongue ~~except~~ slate blue

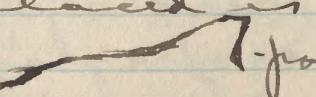

Dorsum has base brownish gray & tips of post $\frac{1}{2}$ real brown - rest light gray - dorsal begins 12 cent. from tip of snout

External characters Dorsal fin has tips blunt & crenulated - post edge white  top of fin mostly crenulated

No. 31 Humpback ♀ June 29 - 08 Keyport & B. C.
Cone Back, sides belly black - rest white from
 pectorals to caudal fin below except a few
 scattering flecks on edges of folds -
 Large heavy circles of white on throat from
 ramus to median line - on breast median
 line circles + between pectorals a large
 patch of white streaked with black - this
 patch extends a little further back
 into the usual white spot between
 fins - circles on right ramus ~~from~~
 almost whole length, heavier toward tip -
 only a little white from ramus to pectorals
 below - Roof of mouth flesh - slate blue
 base as are insides of both nostril
 openings -

Pectorals. Right alone is black heavily
 circled with white along post. edge + at
 tip - 3 white circles near insertion - Left
 fin below has large black patch at insertion
 + for $\frac{1}{3}$ fin rest white heavily marked
 + circled with black -

Palmar Bristles at bases dark gray - post.
 $\frac{1}{2}$ base top real brown + rest light gray -

External Characters. Hump on lower
 dorsal is placed as 96 and - post. dorsal
 is like this  - post. edge almost straight
 himself prominent

No 32 ♂ Sulphurbottom June 30-08 - Kynure, B.C.

Color Top of head, chin, throat & lips as far back as eye dark slate blue - from eye to snout of gills & above on back & upper sides to a point opposite the penis, almost solid light blue gray, marked in only a few scattered places with, elliptical spots having irregular margins - on lower half of sides to penis the ground color is ~~dark~~ blue-gray (not so dark as head nearly) broken with irregular ~~dark~~ patches of the light color of the upper sides - the patches or markings are about 6 inches long diameter.

There begin at the posterior insertion of the pectoral, turn downward along the edges of the furrows to the penis ~~where~~ not meeting in the median line from penis to navel to penis which is clear gray. From penis back the peduncle is almost entirely light gray blue which is marked with darker in only a few patches on the lateral median line - from dorsal fin to flukes the top edge of the peduncle & about a foot down on either side is darker bluish gray & unmarked - just in front of the penis there is a patch of dove colored markings - below fin symphyse to eye, throat is dark slate-blue like top of head & has no markings whatever - from eye to pectoral on the sides of the breast to the

median line are a few scattered dove colored spots from fin to navel there are many white markings on sides - they do not reach median line except on one place from root of pectoral a thick mass of white markings run backward & downward obliquely not reaching mid ventral line - on sides of the funaces just above & in front of navel are many white spots - Pectoral fin above has ~~base~~ proximal $\frac{2}{3}$ dark brownish gray - distal third light gray except the ant. edge which is white - below fin is white

Dorsal fin is light blue gray - almost white on the ant. sides & edge to within about four inches of the tip - the ~~tip~~ tip & post. edge is dark slate blue, The whole dorsal is marked with fine vertical curved lines of darker gray; these run vertically from ant. edge downward, nearly to base & then curve backward along the ~~post.~~ edges of the peduncle, where they are lost a short distance behind the fin.

Flukes. Right has an acuminate slightly recurved tip - the ant. edge is only slightly concave & is rounded - the posterior edge is almost straight proximally & very slightly concave in the distal $\frac{1}{2}$ just before the tips - the post. edge is only 3 mil. thick & is slightly uneven - the tips of the left lobe

Tongue light slate blue - same color as flukes.
~~back tongue~~
 has been injured & is blunt & irregular -
 Above the flukes are dark slate blue, finely
 lined with lighter; these lines run from
 median line of ant. edge across fin most
 gently rounding post. edge - they curve away
 at the tips and are lost in the darker
 color of the post. edge of flukes.

Below the flukes are very light blue-gray
 almost white except at tips & post. ~~edge~~
 which are darker - while undersides lined
 with fine wavy dark lines running
 from middle of ant. edge nearly across
 fin as on upper surface.

Baleen - plates black with a black tongue - bristles
 black & black throughout - Roof of mouth
 black - inside right ramus dark slate upper
 half - lame half milky white - baleen begins 19 mm. Post.

External Characters - Dorsal vertical rows of 22
 soiled white hairs on symphysis - scattering
 hairs on top of head - thickness blubber on
 tip of peduncle is $\frac{1}{4}$ - 5 creases at base
 of penis sheath - median cleft from vent
 to penis - Blubber 25 mm. eye & fin - The
 shoulder blade does not lie ~~parallel~~ parallel to
 the axis of the body (see pl. vi) - the posterior
 end is lower than ant. end making the
 long axis of the scapula slightly oblique
 to that of the body ^{N.B.} (so in all the other ~~sup-~~
 plumbines). The folds between pectorals are
 36 mm. in width - on throat 27 mm. - just in

front of navel 65 mil. wide - A median crease 27 long between blow holes runs from ant. ends not quite to post. ends - no color in blowholes -

No. 33 Syphurbottom sex ♀ June 30-08 Rygmont B.C.

Head, top, dark slate back to opposite the insertion of fin - back & upper sides to arms blue gray - ~~from~~ from pectoral to eye a line of small thick light gray spots - in front of & just above fin the light gray is solid - sides of peduncle from arms back is almost solid light blue gray from first arms on sides much more light color than dark, in some places the light color being solid - Throat & breast to pectoral dark slate like head - no markings to fins on throat or breast - from fins to navel lighter slate blue - many dark colored markings are folded on sides of breast & belly from fins to navel - from navel to genitalia many light bluish gray markings which do not quite meet in center ventral line - the light gray markings come down along the post. ends of the pectorals & turn backward just before they reach the median line - on sides long axes of spots are far & apt - On sides of peduncle just in

pair of flukes ~~are~~^{is} a mass of dark gray markings.
Pectorals Above, ^{right} each slate - ant. edge of distal arm
 half light grayish - tip white - Below pure white
 the dark color of the proximal end of anterior
 edge extends a little way over onto the undersides
 of fins - Tip like right, only tip has been injured

Dorsal, Dorsal low + pointed - ant. edge is
 light gray - almost white - earthen at tips +
 posterior edge - fin is marked with fine
 curved light lines

Baleen - begins 17 from tips of snout - baleen is
 black as are bristles -

Flukes Notch 22 deep + there is a V fluke is
 slate above finely lined from ant. edge -
 post. edge from notch to tip is dark slate -
 Below same as in no 32 - post. edge a little
 ragged or uneven - in shape just like
 no 32 - Epidermis peels off very easily
Roof of mouth - black - tongue light purple -
 inside left ramus very light blue - almost
 white

External Characters One barbule on fluke
 below just at the side of the notch - 13 hairs
 right side top of head - chin is 95 long + 17 wide;
 it is a ~~long~~ long oblong patch of smooth skin
 from symphysis downward for 95 cent. cl^t
 has a low median ridge - 41 colored white hairs
 on symphysis - none on rami -

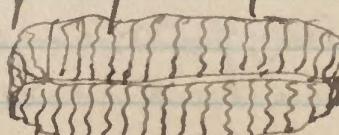

Mammas The skin containing the mammae are
 only slightly raised above the general level of the
 peritoneum below - Each mammary crease is 17 long

+ are the outside of each in a crease or furrow
30 long - the test is 40 from anus + very slightly
behind vaginal opening -

Navel not raised above level of body - a shallow
depression runs from vulva to navel -

No 34 Fairback ♂ June 30 '08 Kynmont B.C.

Color & Top of head and back, to a point opposite
the navel is very dark slate - the ~~any~~ elevated
edge of the right side top of head back to eye +
from eye to blainholes is light French gray;
this light color extends from eye to fin + ^{slightly} ~~fin~~
above fin, - from ones to fleshes the whole pe-
duncle except the very median line below
is light French gray. On the sides of the ped-
uncle, ^{from navel to fleshes} are many markings which look
exactly like the grainings of wood - these
spots have a central ^{yellow} ~~light~~ line running fast + off
+ the light gray wavy line radiate from it
like this  These spots seemed
perfectly healthy + I am sure
are not the result of parasite attachments

Below the median line + lower half of sides of body from symphysis to penis is pure shining white - the bottoms of the furrows of the lower half sides of throat + breast ~~— and of the~~ are dark slate, but the folds are white - the ventral portion of the throat + breast to penis has the folds pure white + the bottoms of furrows ^{left} pink or flesh color - from insertion of fin diagonally backward + downward extend two long prolongations of dark color ^{or arms} ~~on arms~~ + all of left ramus. The upper half of left side of throat ^{+ all of left ramus} from the insertion of fin is dark slate almost black - from fin on upper sides almost opposite to ramus the dark slate of the back shades off into a very dark sepia. This in turn shades off into the light gray of the peduncle - From ^{opposite to fins} ~~now~~ the light gray comes of the sides comes down farther + farther toward the ventral median line making this ventral line of white narrower + narrower. Right side has top of head (as described) + entire right ramus light French gray - rest of right side is like left -

Roof of mouth light violet - tongue light slate blue - inside left ramus upper half white - lower light gray - inside right ramus dark slate

Fishes Below white; post. edge + anterior is dark brown - above dark slate - the notch is 17 deep + the sides overlap each other —

Dorsal Fin is high & strongly falcate - it is dark gray or slate like back

Pectoral Fins Above fins are dark slate like back - ant. edge white and fin below all white. The post. edge of fin is very thin & loose; it curves out. (See photos of fins)

Baleen Left side - outer edges of baleen plates ^{with a pink cast} lead color, the lead color extends in a longitudinal band from base to tip of plate & along outer edge & is about one inch wide - rest of plate is yellowish white. ^{lead} white

Right side The anterior portion of the baleen row has the plates all white - the rest of this side is like the left. The length of the anterior white portion is 81 - The bristles throughout are pure white - baleen begins 15- from tip of snout.

External Characters Blubber on sides & thick

Posterior edge has two areas extending backward from the posterior end, but not reaching the areas - areas are elliptical opening 24 long -

The navel has a space the width of four fields & large in front which is smooth - the furrows of the belly end abruptly just opposite the middle of the navel -

The two concave ~~smooth~~ depressions on the under-side of the tip of the rostrum just in front of the beginning of the baleen were present-like this) (

The center of the eye is 11 behind corner of mouth - a median crease extends ant.-post. between the

blowholes - it is exactly the length of the blowholes.

Osteology

I counted 12 chevrons + one or possibly two more should be added for the caudals which were cut off with the flukes - the 1st chevron is very large - its haemal spine is the widest (ant.-post.) of the series but is not the highest. The spines of the 2nd + 3rd chevrons as they lie in position are the highest of the series - the two are the same height - the spines of both are narrower (ant.-post.) than no 1.

There were 14 pairs of ribs present. 16 lumbar + 12 + caudals

C₇ D₁₄ T₁₆ L₁₂ + (this is certainly correct)

Fins

Spur

Length (straight) = 410

Breadth (square root) = 206

Jaw

straight = 400

curved = 420

When the vertebrae were being torn apart by the steam wrench as the carcass was cut up, I noticed that several of the terminal epiphyses of the vertebral bodies ~~were~~ came off apparently easily; this would indicate that the whale was young.

Stomach The stomach of this whale has a V-shaped lower process & two transverse

processes each bearing on its upper edge a high rounded emarginate lobe - between these lobes is a deep, horseshoe shaped opening - The sternum articulates to the distal ends of the 1st pair of ribs - the ends of the ribs fit in to the angles formed by the lower sides of the transverse processes and the ventral spine or process. The end of the rib is 50 mil. from the sides of the ventral process & of the sternum and the upper side of the distal end of the rib is 20 mil. from the lower edge of the transverse processes - (These measurements were taken shortly after the whale was shot was taken out of the whale) The rib is tipped with cartilage, but articulation to the sternum is by ligaments & not by cartilage as in the Humpback.

Sternum greatest breadth = 550 mil.

" height = 490 "

The first rib is flat for its entire length & strongly curved having a single pointed head, a long slender neck, & a ~~knobbed~~ tubercle - rib is widest at the distal end

Rib Length straight (tubercle to end) = 983 mil.

Curved (distal) = 1114 mil.

Breadth at distal end (greatest) = 150 "

Scapula The acromion & coracoid project almost straight anteriorly

Height (g. from tip of spine) = 650 mil. Length acromion to spine = 260 mil.

Breadth glenoid fossa = 110 " Length coracoid = 160 "

Fist dorsal - Has a ^{high} spine directed slightly backward just at the side of the posterior zygophyses is a prominent tubercle on either side - the transverse process projects backward and downward

1st dorsal Height = 850 mil. Height body = 190 mil.
Breadth = 350 " Breadth " = 285 "

Fist Dorsal (measurements are posterior end)

Height = 690 mil. Depth body = 210 mil
Breadth = 1020 " Breadth " = 290 "

Fist Caudal (measurements are posterior end)

Height = 690 mil. Depth body = 270 mil.
Breadth = 700 " Breadth " = 310 "

The inferior canina of the first caudal is widened posteriorly and practically obsolete anteriorly; the tubercles for the articulation of the first chevrons are small.

Atlas Has a transverse process which projects outward & ^{slightly} upward. The laminae of the arch meet in a spine 20 mil. high
Height: 360 Height body: 250 The base of the
Breadth: 580 Breadth " = 270 neural arch on
either side is perforated by a horizontal
foramen as in the Humpback & Sperm-

Axial has an upper & lower process which ^{united} meet distally by a wide margin enclosing an oval foramen or opening which occupies a little more than the proximal half of the process. The lower

process is much thicker & heavier than the upper. The laminae of the arch meet in a wide square crest which is grooved on top in two places forming between them a low ridge - The two transverse processes project strongly backward & very slightly downward.

The 3rd, 4th, 5th & 6th cervical have an upper & lower transverse process which are joined distally by a narrow margin - the arches of all these have a low spine.

The 7th cervical alone, has only a wide flat ~~parapophysis~~ & no ~~parapophysis~~.

		27 - 115	38 - 335	

No 35 Sushibottom of July 3-08 Kyugnat B.C.

Color A very light whale, Top of head to eye + sides light slate - eye to feathers on back, all light blue gray, almost solid; there are a few darker markings which show plainest on lower edge of peduncle & on sides just below dorsal -

Belly & breast is blue gray marked with the lighter of the back + sides - From fins downward & backward on belly folds, not meeting in the median line are many a dove colored markings - there are a few of these markings on the breast (center) opposite the eye - The spots which cannot be seen along the posterior ends of the

furnaces need in the lower mediotarsal line
from snout to pectoral fin

Tongue blue - inside body rami upper half
white - lower half light blue gray - roof of
mouth black -

Baleen black including bistles - baleen begins
2° from tip of snout

Flukes Almost ^{left & right} blue gray finely lined with darker
lines do not reach post. edge
which is dark & very thin - the
end of the ~~post.~~ fluke is blunt - has been injured

Dorsal Fin Below flukes is light, finely lined with
darker -

Dorsal Fin is blunt - has been injured -
it is only a kind of nub & looks like
this

Pectoral Fins, ^{Left} Fin above like head - has
a few spots or markings proximal.
half - distal half is flesh colored with
many gray markings on proximal third
these markings mostly take the form of
fine lines running from post. edge
half way across fin -

Right fin same above - below
flesh colored, with long narrow long -
itudinal gray lines mostly near
the anterior edge and all distally -
the dark color of the upper surface runs
over below at the ant. edge proximally -

External Characters The dorsal ventral row

of white hair on symphysis - blubber very fat & soft - two marks) (on tip of snout)
 Folds on throat are 40 mil. wide, between fins 55 mil. wide & at end on belly 80 mil. wide.
 Fins are 30 mil. deep - one hamache
 scar on right lip - This whale contained
 fetuses no 35-a ♀

Skull Length = 610 Jaws Length straight = 5' 9 1/2
 Breadth - 297 " curved = 64 1/2

There are 16 ossified chevrons - the usual first chevron is not present, & is represented by ~~a~~ a nodule of cartilage on each side, only - there is no ossification whatever in it -
 The first ~~the~~ chevron of the series is large & not joined distally; the ten laminae forming this chevron are not opposite each other - the one on the right side is half its length behind the one on the left -

The 2nd chevron has a well marked spine; the 3rd & 4th are the same height as they lie in position, & the highest of the series. After the spine of the 4th is no longer than that of the 3rd, it is much broader ant. posteriorly. Only 14 pairs of ribs were present - I examined both sides most closely when I discovered this, so that there is no possibility of mistake - the last pair were long, the usual short terminal pair being the ones which were missing.

1

Synaphobatidium

No 35 a ♀ Foetus from No 35 July 3 - 08 - Kyugnot B.C.

The anterior corner of the eye is directly above the corner of the mouth -

Pelvins From the arms backward the upper & lower edges slope only very gradually toward the flukes - they are almost parallel - just in front of the insertion of the flukes the two edges turn abruptly to the flukes - the distance from the notch of flukes to dorsal fin is contained in total length $3\frac{1}{2}$ times.

The body is widest at a point opposite the tip of the fins laid back - Blowholes one is a little below the level of the highest part of the back - The anterior of scapulae is higher than posterior end when in position - the caecoid & a sacrum point in toward the body -

15 pairs of ribs - 18 chevrons

No. 36 Syphaxiatus ♀ July 3-08 Kyugnot B.C.

A light whale - The top of head to off-white ear is light slate color - from ear to flukes on back & upper sides ground color is light blue gray - just above fins ^{a line going} & forward to eye is a mass of very light gray markings, small & very thick; in some places this mass is solid - These markings sweep up over the base of the fin & turn downward along the edges of the pectorals to a point about three feet beyond the tip of the fin and back where they end.

Rest of lower half of sides to flukes is light blue gray, marked only in the following places; in scattered places with either blue gray; from a little behind ears on sides there are very few darker markings & these are altogether ~~just~~ about 3 feet in front of ~~ear~~ in ~~ear~~ of flukes - the front ~~ear~~, ~~lip~~, ~~thorax~~ back on sides of peduncle there are some of exactly the same markings as were on the Finback

which look like the knots of wood - from navel to under belly are small irregular markings, very light gray, almost white. Throat & breast & lips, to about three feet behind fins is light slate like head - rest of belly is like peduncle, light blue gray - from the insertion of fins running obliquely backward & downward, toward but not meeting sir, the median line are scattering dark colored markings, with now & then a tho white one - there are a very few dark colored ones on the breast just in front of insertion of fins.

From dorsal fin to flukes top edge of peduncle is entirely solid color - no markings whatever

Flukes - light blue gray below, lined with lighter lines, almost white. Above rear of head (light slate) lined with lighter ^{notch 13 deep}

Pectorals Dine slate; ant. edge white for distal $\frac{1}{3}$ - 4 markings on top at insertion

Below fin is milk white

Dorsal fin is only a rounded ridge like this

bottoms of furrows from a point opposite tip of first back, all pink - rest of are the furrows same color as pedes -

External Characters Noich of flukes 13 deep - Median crease between blowholes only 38 long. The tail is 5 long - its tip is divided into small fringe like processes

the abdomen so large enough to admit the end of my little finger - there are 19 hairs on the symphysis in the two ventral rows - the navel is 17 long.

Osteology

Skull Length = 560

Breadth = 280

Scapula Inner surface has several prominent veins radiating from opposite lower edge of acromion upward. The suprascapular border is flattened in the central portion & dips sharply downward to the glenoid edge posteriorly - the dip to the coracoid edge anteriorly is not so ~~as~~ abrupt or so long.

The acromion projects only slightly downward; it is broadest distally; it is curved inward only very slightly.

The coracoid projects downward & strongly inward.

The suprascapular edge turns outward very slightly thus making the outer surface of the scapula a little concave - Suprascapular edge is 20 mm thick posteriorly; 15 mm in middle & 5 mm thick anteriorly.

Scapular measurements

Height = 930 mil.

Breadth = 1500 "

Length acromial (median) = 470 mil. Breadth glenoid fossa: 370 "

" .. (lower edge) = 490 " Priscapular fossa are

" coracoid " = 130 " spine well marked -

6:11:10:2

A plenary arrangement of data in re-
gard to period of gestation of Humpbacks

On May 22 I took a foetus 2 inches
long from a humpback - on the 1st of June
a foetus 8 inches long was taken - on
June 13 a foetus about 18 inches long
was taken - on June 27 a foetus 45 inches
long taken - The calf must be from 10 to
12 feet long when born, according to the
size of the uterus - Now supposing that
the whale which contained the foetus
2 inches long, bore about the first of
April; from April to July is 3 months.
The growth from April to July is
45 inches which makes 15 inches per
month - Supposing the calves to be 144 inches
long when born then the mothers would
carry young for about 9 $\frac{1}{2}$ months.
This rate of growth is probably a
little too rapid, making the period of
gestation about 12 or 14 months.

On June 16 a calf 25 feet long which
was still sucking was killed with
the mother. This calf must therefore
have been born the year previous.

Measurements of No 36 ♀ Sibogia.

1 - 2370	11 - 3	29 - 63
2 - 1070	12 - 640	30 - 7
3 - 530	13 - 690	31 - 43 -
4 - 650	14 - 710	32 - 32
5 - 450	15 - 1030	33 - 10
6 - 830	16 - 505	34 - 119
7 - 1815	21 - 6	35 - 370
8 - 120	23 - 122	36 - 38
9 - 16	26 - 26	37 - 37
10 - 9	27 - 190	41 - 200
	28 - 65.	42 - 36
		43 - 80

greater breadth of gillies
and to first cusp is 129
The lower jaw ~~was~~
was closed tight over
upper jaw and could
get the measurements
~~of its length~~ from
its tip to tip of lower
jaw absolutely correct

Humpback ♂ July 14-08 Kuyugut B.C. Length = 1200

This whale had a very short upper jaw or rostrum -

Humpback ♂ July 14-08 Kuyugut B.C. Length = 1260

Throat + breast nearly to naval pure white, - only
one or two black dashes in this white area +
one median line is black.

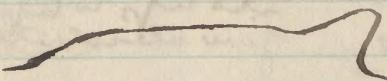

Osteology

Ten chomous - the first small + free distally
the 2nd very large & almost as high as 3rd which
is highest of the series - last small + free distally
14 pairs of ribs C₇ D₁₄ T₁₁ Ca 20 = 52 ~~mm~~

The last caudal seems to be composed of two sub-
joined portions but it is not certain enough
to count it as two. In all the whales I have
examined both Nephoptera & Balaenoptera there seems
to be a frequent ankylosis of the terminal vertebrae
sometimes being ~~one~~, two + even three joined.

Humpback ♂ July 6 - '08 Kyugnot B.C.

Length 1330 Very little white on throat
+ breast except in bottoms of furrows -
The hump of this whale was prominent & the
saddle fin peculiar - like this ↴

Humpback ♀ July 6 - '08 Kyugnot B.C.

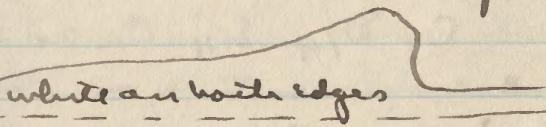

Length 10951 Back sides + belly black -
white only in median line of throat + breast
to pectorals - white spot between pectorals.

Humpback ♀ July 6 - '08 Kyugnot B.C.

Length = 1220 Much white in patches below
from tip to flukes - white on sides of peduncle
in patches + circles -

Humpback ♂ July 11 - '08 - Kyugnot B.C.

Length = 11651 - same fin like this

Humpback ♀ July 11 - '08 Kyugnot B.C.

Length = 10951 - This whale was mother of
no 39

(Scapula saved 2)

Skull Length = 295 -

Breadth = 170

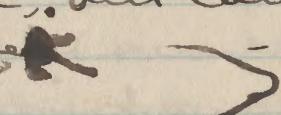

Jaw straight length = 286

Curved " = 310

There are 10 chevrons present of which the 3 4

is largest of the series — 14 prs. of ribs +
12 lumbar —

Vertebral formula is

$C_7 D_{14} S_{12} Ca_{19} = 5-2$ (This is absolutely seen)
A terminal knob of cartilage was present +
with the complete form of the terminal
caudal, but containing no ossification
whatever  — form of terminal cartilage

Humpback ♀ July 1-08 Keyesport B.C.

Length = 1160 (Contained a foetus 91 long
the foetus had 22 pectoral furrows —)

Spine Length = 320 Jaw Length straight = 310
Breadth = 190 " curved = 335-

10 chevrons present — 3rd largest of series
14 prs. ribs

$C_7 D_{14} S_{11} Ca_{21} = 5-3$ (absolutely seen)
terminal caudal the size of a pea but fully
ossified —

Scapula

Height = 76

Breadth = 1110

" dorsal form = 290

Length coracoid = 50

The inner surface is strongly concave and the
outer much less strongly convex — the
super-scapular border is evenly convex, the
highest point being nearly in the center
The coracoid is represented by a ~~broad~~ well
marked knob or projection directed
strongly downward & inward.

July 1 - 08 - 1 Kypgrot
Humpback ♀

Length = 1340 (containing a foetus)

Flukes (tip to tip) = 373

Left lobe = 217

Right .. = 217

Humpback ♀ July 1 - 08 Kypgrot

Length 1090 - Flukes above & below black with a few white oblique markings along post. edge & at tips - Also a few on ant. edge of distal $\frac{1}{3}$. - Ant. edge is convex especially toward the tips - post. edge convex from notch nearly to tip which is convex - edge irregularly scalloped

Humpback ♂ July 1 - 08 Kypgrot

Length = 1290 ~~foetus~~ This whale is entirely black below except for a little faint white in bottoms of folds where they end - there are 4 white circles on the very chin -

Humpback ~~♂~~ ♂ July 1 - 08 - Kypgrot

Length = 1420

A very heavy whale - little white on throat & almost none on breast ~~or~~ belly

Humpback July 2 - 08 ♀ Kypgrot

Length 1145 - very black - only a very little white on median line of throat & breast - white spot between fins -

Sedchart B.C.
Whales from Jan. 1 to May 16 - 07
averaged 5 tons oil per whale - 256 gallons
to the ton - 9 1/2 lbs per gallon

177

Humpback No 31, ♂ June 29-08 Kyuquot
A calf about 28 feet long with a very short head - Pectorals above & below pure white - above have a small black patch at junction.

Humpback No 31 b. June 29-08 Kyuquot B.C.

Length = 135.0 - ♂ White areas on chin & throat, but only a little white in median line of breast - white spot between pectorals no white on left ramus - top of head, back, sides, & belly black - dorsal fin is a prominent hump 13 cent long - dorsal 32 cent. high - both edges white -

I had the whole mass of flesh ~~removed~~
about the penis removed from the whale
and cut away the surrounding fat and
flesh from the penis & pelvic bones, taking
care not to injure the attachments
of the latter - The internal view of the
penis bare (the surface lying toward the
back bone) shows two great ligaments (very
tough) which branch from near the
~~oblique~~ base of the organ. These branches
are 320 mil. in length, the posterior
ends stand 500 mil. apart, and the
ant. ends when they meet to branch
from the penis are 20 mil. apart -
in the median line of this surface of the
penis, extending clear to the root & pelvis.
The two branches is a rounded ridge which
marks the course of the urinary canal -

at the posterior end of these branches on either side & connected to them by ligament are the pelvic bones - There is a knob of cartilage on each end of the bones which makes them seem much longer than they really are - The pelvic bone is only connected to the penis by ligament at its very posterior end - the remainder of the bone is embedded in the fat & periosteum above the penis, but has no ligamentary attachments - The bones do not lie quite horizontally in the body, but have the short and exterior ends somewhat further in toward the spinal column than are the posterior ends - thus they lie a little obliquely to the general axis of the body - With the ant. & post. arms of the bones are slightly curved anterior or dorsalward viz. toward the outside of the body - The posterior ends of the pelvic bones as they lie unjoined are 540 mil. apart. The ant. ends are 600 mil. apart.

June 7-08 Sehaw -

The Orient today took in 6 whales -

5 ♂ + 1 ♀ -

No 1 a ♂ - Side & belly black - on belly back of pectorals more white whatever is both train & the massive caudal heavily with white - from the snout to between the pectorals in median line particularly there is much white - on the throat this white is small flecks & patches, but anterior it is long streaks - the white areas in a large spot directly below pectorals.

Pectorals all ~~are~~ shiny white below except a small black patch at insertion - the posterior edge and top have a narrow black edge -

anterior edge white - Both flippers are the same below - Throat fins are 22 in number

No 2 ♂ Sides of body black - throat & front back to about 3 ft. from navel is white dashed with broad black streaks Left pectoral has the usual black patch at insertion below which extends $\frac{1}{3}$ length of fin - rest of fin below dashed with black along anterior edge & tip chiefly - both edges black - Right fin black above heavily

circled with white along posterior edge -
the white circles are mostly confined to
the $\frac{1}{3}$ of fin at tips - white from arms
to flukes - 10 fins

No 3rd Sides of body & belly black - 2 white
spots at navel - Shins & throat & breast
is not heavy mostly in flecks & splash.
The white ends in a large V shaped
patch between pectorals in median
line point of V is backward - in
the bottom of the furrows the arms
of this are silver color on top of
feel it is fine white -

Right pectoral above has no white
or it is lighter but is the very
slashed with barnacles - Left
fin below has a large black
patch at insertion - rest of
fin is white heavily marked
with spots & dashes of black -
webbed barnacles along tip and
posterior margin -

No 4th Belly black back of pectorals
dark but scattering white flecks
on the edges of some of the folds -
lower edge of pectorals black -
Sides of body black not much white
on throat & breast - mostly confined
to circles - Right pectoral above is

black along posterior edge for whole length of fin - black extends to middle & is heavily circled with white - anterior half of fin for whole length is white circled with black -

No 5 ♂ Thorax & breast to pectorals are heavily marked with white in streaks & patches mostly - in bottom of fin on the right caudal streaks are salmon color - belly to penis is heavily flecked with white along edges of the folds - great mass of barnacles about penis
 Right pectoral black above heavily circled with large white circles along posterior edge -
 No 6 ♂

Sides black - belly black except for a few small flecks of white along edges of folds - on sides of throat & chin many large white circles - these run down on centers of breast to pectorals but not on sides of breast except in a few places. Right pectoral white below with a few black circles on the $\frac{1}{3}$ toward tips - middle from penis to flukes pepper salt - Left pectoral black above heavily circled

With white on the $\frac{1}{3}$ toward tip —

20 breast furrows

June 16 - 08 Sechart B.C.

Today three calves were shot in which I did not dissect & measure. They were all females, two old & one very young. The calf was 25 feet long & was still sucking as we found the milk glands well developed & full of milk in one of the females.

The calf was very fat & had thick blubber; its' vulva had the busters of the extreme bases of the plates dark gray & all the rest from ant. to post. pure white without any gray shading whatever — The excrement was unlike that of the other calves — it was a light brown — probably due to its diet of milk.

The milk glands of the female lie along either side of the ventral line of the body, but are not parallel — the anterior ends are much further apart than the posterior. The glands lie anterior entirely to the mammary slit, joining this slit at the posterior end. The anterior ends of the glands lie 77 cent. apart.

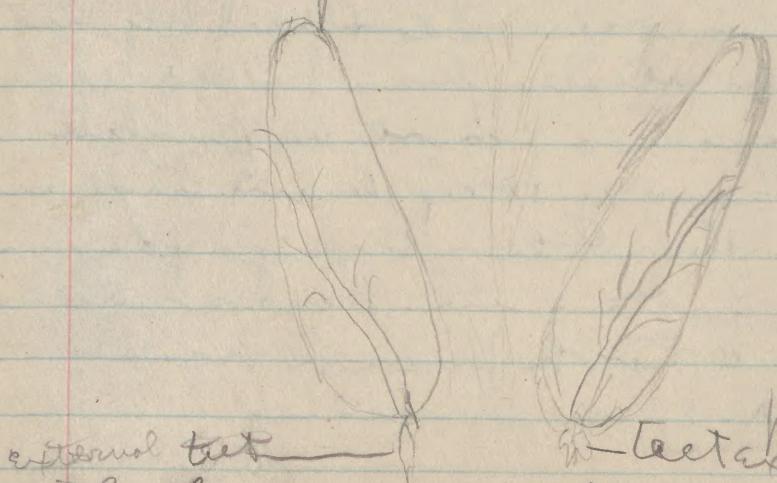

~~Sitaphorus~~ ⁴⁸ ~~for~~ Vogel ~~in~~ ~~the~~ ~~same~~ ~~place~~
 the posterior ends being 18 cent apart
 (inner edge in both cases) From the
 teat, a large tube 3 cent. in diameter runs
 forward with the milk gland; this tube
 has numerous branches much thicker
 than found in the lungs. The milk
 glands are ^{very} light browned, & when
 cut into, the flesh looks mud like
 the lungs, except for color. Numerous
 small vessels, which were full of milk
 run thru in every direction.

The gland measures as follow:

Total length	= 137 cent.	4' 6"
Greatest width ant. end	= 25 "	8 $\frac{3}{4}$ "
" " post. " = 42 "		17 "

The glands look like this as they
 lie in position;

ant. end

post. end
 external teat

The thickness of the gland is about 12 or
 14 cent. They were both full of milk

which ran freely when the gland was pressed: The milk is white & looks exactly like very rich cows milk - I tasted & found it sour & a little acid - & had a decidedly whale like flavor - I can best express it by saying that it tastes exactly as a whale smells - and I don't want any more of it.

Out of the last seven whales six of them have been females - quite in contrast to a short time ago where we got most all males. As Capt. Baldwin tells me that mostly all the whales for a week or two at a time are killed from the ^{same} school it would appear that at certain times in the year the males & females separate & hunt by themselves when the whaler has picked all the whales from a school or frightened them away they hunt up another herd. The other large female had a foetus in her, as large as one I took from No. 22 about 18 inches long.

June 17-'08 Sedhart
Five whales today all females -

June 18-'08 Sedhart
Four whales today - 2 males 2 females
One of these females measured
51 feet -

June 22-'08 Sedhart

Five Humpbacks today - four
♀ & one ♂. Two of these had a
great number of white flecks
about the size of a half dollar
Scattered over sides from pectoral
to flukes - One other had a great
amount of red-pink in the
bottoms of the furrows

These last ¹⁴ whales were all
from a different school than
the others which I measured -

1907 season's catch - B.C.
Humpbacks (Feb to any month) 76.24 \$0
Spermwhales (Aug. till Feb 1) 15.26 \$0
Finbacks (at any time) 81.21 \$0
Sperm (March) 29 \$0

3 sperm year before
Total catch 341 whale

Alcibiades

No

- I Eye of whale no I
