1851. *Alouatta* ♂ TL. 585. LT. 176.
LT. 72. HS. 135. LT. 35.

Shine skull & leg bones.

They chiefly feed on the coco
nut that is fairly abundant
in these forests but also
devour the fruits of many other.
~~It takes~~ During the day ^{they take} refuge
in hollows ^{or burrows} principally in
rotten tree trunks but

any on the ground in which
they also arrange their
During the night only they
were trapped; the natives
have no great difficulty
after they have traced their
habitual resting place, they
set ropes along the trails
as they have a habit of passing
quite often exactly the same
way, I could never find out
exactly how many there may
be together in one hole though
once four were taken in one
of their hiding places, one female
& three more than half grown

Orange Oct 31/1913

1851 The natives state that often as many as ten live together. They have absolutely no difficulty in running up slanting trees but are surely unable to climb. Most astonishing is their performance of leaping about 2 to 3 feet clear from the ground ^{governing direction of fall} they usually are unable to run ^{in one direction} fast on perfectly level ground but could several times observe on specimens set free in villages, but in their habitat in the forest they disappear as rapidly as most ~~of~~ the other animals. One hardly gets more than a glimpse. They look then just like big cats. If irritated they carry their tail in a half circle upward on their back & by a sort of trembling movement of the tail make a rattling noise.

85/ They also raise their spine on
the posterior half of the body but
chiefly the back, with head
now raised, ~~but~~ lowered
on the hanches they
rapidly hit the ^{on the other end}
of the hind feet ^{with the whole plant} on the
ground (it's done so rapidly
that it is really impossible
to see it exactly) producing
thus a fairly loud tapping
noise. When touched
on the back it makes a
rapid movement backward,
but when touched for instance
on the sides of its neck it
actually throws forward its
posterior portion of the body
sideways. This doubling
up must be a formidable
weapon, but in spite
of this I have twice formed
remains of them in stomachs
of leopards, for which it must
be an easy prey. They usually
have one or two young

Cheng Oct 31/1913

1851. That are quite interesting. The
foetal specimens still more
so, ^{very dense} ~~characteristic~~ on some ways
of pangolins, as the spines
grow not like hair all
over the body but just
in a sort of open half circles
much more ^{following the arrangement of} ~~than~~ scales
the ^{free} distances between each
set is about the
same as that of pangolins.
This chiefly applies ^{to scales of} ~~to the~~ back portion.
The tail carries a tuft of
course hairs & flattened
hollow copulations 2/3 mm
wide & 5 to 10 mm long
By these latter appendages
no rattling noise is
produced. The natives
believe firmly that they
can shoot their spirits
off or in the direction
of their enemies. The reason
for this is quite easy

1851. To comprehend when one
can see the rapidly moving
animal when attacked
darting about so rapidly
that one ~~cannot~~ ^{is unable} follow ^{its} ~~the~~
movements & there might
be somewhat of truth
in this belief. The fact is
that the living animal
can certainly loosen its
springs then they will drop
out in these fights with
surprising ease. After
death however they stick
rather firmly in their
deep set calls. The skin
is extremely tender & it is
very difficult to skin these
species. The ^{meat} ~~meat~~ is considered
highly by the natives a delicacy.

cleaned. Skin & complete skeleton

Jan 29 was slightly decomposed.

2425. Cercopithecus (Nasali)

52413 ✓ ♂ TL. 1520 LT. 1020. LH. 165. HS. 350

Hair light brown

skin & complete skeleton

Memphis Feb 1 / 1914

No 2426 ~~other~~ (with claws)
51827

♂ ad. chrome yellow, breast &
between hindlimbs, but the
anterior part of light breast patch
is nearly white & only in front
of the scrotum, ^{chrome} yellow, the rest
of triangular light patch white
♂ Tc. 1070. Lt. 445. Cl. 127. HS. 172. TL 18.

Spin of skeleton, the terminal
phalange is on the skin.

2427. ♂ Tc. 1035. Lt. 435. Cl. 125. HS. 90.
51923

Lt. 17. This specimen practically lost.
The larger white & chrome yellow
markings on ^{lower} rect, breast &
between hindlimbs, has only
a few dots.

Both were shot in the Brune
river in an open place partly
shut in above & below by fallen
trees. They were fishing together
in fairly deep ^{but gentle} water (4 feet). They
often had been observed here before
in the afternoon (4 to 6 P.M.). The
large species (blowless) had been
shot in exactly the same spot &
which evidently offers an abundance
of food. See photograph of this place.
